The meeting terminated with a brief speech from the President, Sir THOMAS BARLOW, expressing the gratitude of all concerned in the working of the Congress to the secretaries of the various sections, and especially to the secretary-general, Sir Wilmot Herringham.

PUBLIC HEALTH ADMINISTRATION IN EGYPT DURING 1913.

Earl Kitchener, in his Report on the Finances, Administration, and Condition of Egypt and the Sudan in 1913, publishes an annual summary of progress, in continuation of the intellectual and literary reports with which Lord Cromer used to charm us.

In spite of the abnormally low Nile of 1913, followed by a shortage of water which was the worst on record for more than a century, the year's progress was far more satisfactory than might have been anticipated. Famine, the necessary accompaniment in the past of a very low Nile flood, was averted by the thickening and heightening of the Assuan dam, which fortunately had just been completed. Sanitary improvements depend upon the state of the Treasury, and funds in rainless Egypt are dependent upon agriculture, which in its turn requires every year a wealth of Nile water.

The Public Health Department.

Space compels us to restrict ourselves to the Public Health Department, which now, for the first time in its history, has a strictly scientific Director-General in Sir David Semple. In order to give him a freer hand for dealing with the endemic diseases of the country two sections have been pruned away; the two lunatic asylums have been made into a separate department under Dr. J. Warnock, and the veterinary section and school have been transferred to the Ministry of Agriculture. History in Egypt invariably repeats itself, and a new Board of Health, with consultative and advisory powers only, has been created to assist the Director-General. We may hope that it will prove more useful than its predecessor, which came into existence in 1825 and was abolished in 1884, chiefly because it was incompetent to deal with the cholera epidemic which devastated Egypt soon after our occupation of the country.

For many years the energy of the Public Health Department has been principally occupied in fighting three epidemic diseases—plague, cholera, and rinderpest; but Lord Kitchener has now decreed that the chief endemic diseases, such as ankylostomiasis, bilharziasis, pellagra, and typhus fever, must be seriously studied and taken in hand. He rightly points out that the equipment of hospitals for treating the sick does not strike at the root of the evil, and that preventive measures must begin with village sanitation. He has already persuaded the villagers to fill up many of their bilharzial and other ponds, which are fruitful sources of infection. The land thus reclaimed is useful for providing open spaces for the inhabitants of the villages, which consist of overcrowded mud huts, unventilated, and for the most part unprovided with latrines. With the help of prison labour 109 ponds, with an area of 93 acres, were filled in during the year. The lines upon which he thinks sanitary progress in the villages should proceed are (1) education of the people in the causes and prevention of their common diseases; (2) formation of partly trained inspectors of the sergeant class to work under the district doctors; (3) improvement of houses and water-supply, with the gradual introduction of simple latrines.

Travelling Hospitals: Campaign against Ankylostomiasis.

The success of the travelling ophthalmic hospitals and dispensaries, which take the operator and treatment into the heart of the country, has been so great that the Public Health Department determined to imitate this system, and accordingly last September a temporary ankylostoma hospital was opened outside the town of Kaliub, about one hour's distance by train from Cairo. The ankylostomiasis campaign will also include investigation into bilharziasis and pellagra, because the unfortunate peasant is often the victim of all three scourges, and in order to ensure that it be started with all proper experience of organisation and of the habits and customs of the people it has been placed directly under the control of Mr. A. F. MacCallan, who will, therefore, be unable to concentrate his energy exclusively upon the campaign against ophthalmia. This latter can safely be trusted to other hands, for there are now 17 special ophthalmic hospitals in various parts of the country, all provided during the last few years. The oculists, English and Egyptian, had the satisfaction during the year of curing some 25,000 patients and of performing 30,000 operations, mostly on young people, for the relief of trachoma and ingrowing eyelashes. When a travelling ophthalmic hospital has been in one of the small towns for six months and has been crowded every day with eager out-patients, it is now not uncommon for the local Egyptian authorities to wake up to the need of a permanent eye dispensary, which is thus sometimes provided from the local rates.

The first ankylostoma hospital consists of 100 beds for both sexes, sheltered in tents or huts of matting, the only camp furniture necessary being wooden trestle beds with matting to lie upon and blankets to lie beneath. Great attention is paid to the latrines, which are screened by walls of matting, because their cleanliness and the microscopical examination of the excreta are obviously of educative value, a value not less important than ridding the individual of his intestinal parasites. Since 17 per cent. of the Egyptian lunatics are found to be pellagrous, it is surely time to find out how many of the sane are affected, and we are glad to see that Lord Kitchener looks forward to "a prolonged, well-organised, and thoroughly scientific investigation of pellagra in connexion with the ankylostomiasis campaign."

Infant Mortality

that the vigorous personality of the present Agent and Consul-General is causing them to bear practical fruit. The area of the country infected by plague remains as before, but the total number of cases fell during the year from 884 to 654.

The School of Medicine.—Education of Girls.

The School of Medicine continues to flourish, with a total of 258 students, but it is still difficult to find young Egyptians who are willing to devote their lives to the purely scientific and less remunerative branches of the medical profession. Three additional posts have been created, which for long have been wanted, assistants to the professors of biology, chemistry, and anatomy. There are also 209 Egyptian students who are now studying medicine in Europe, mostly unconnected with the Egyptian Government.

The ruined condition of the buildings at Kasr-el-Ainy Hospital in Cairo, where all the young men and women who enter the profession are trained in hospital life, is not referred to in this report, but it is obvious that a military barrack, constructed more than a century ago and now past repair, is unfitted to serve as a model of what a great hospital ought to be.

The most wonderful change at work in Egypt is the recent public interest in the education of girls. In any country this would be noteworthy, but in Egypt, where only two women in every 1000 can read their own language, while still fewer can write it, this constitutes a silent revolution of the greatest possible importance. Elementary schools for girls are springing up, in which needlework, cooking, laundry, and elementary hygiene are taught, in addition to reading, writing, arithmetic, and the Koran. In defiance of all tradition and without losing caste, it is now possible for an unmarried Egyptian girl, who has been trained as a teacher in Cairo, to leave her home and migrate to the provinces to take charge of one of these new schools for girls. She thus often becomes the breadwinner of the family, for her salary may rise to £300 a year, perhaps ten times more than her own father has ever earned. After centuries of prejudice both men and women seem to be realising a verse of the Koran: "A man can find Paradise at his mother's feet."

VITAL STATISTICS.

deaths from scarlet fever, which had been 24, 24, and 30 in the three preceding weeks, fell to 23 last week, and included 6 in Manchester, 3 in London, and 2 in Salford. The deaths from enteric fever, which had been 16, 8, and 13 in the three preceding weeks, rose again to 16 last week, and included 5 in London and 2 in Newcastle-on-Tyne.

The number of scarlet fever patients under treatment in the London Fever and the Metropolitan Asylums Hospitals, which had steadily increased from 2862 to 3088 in the seven preceding weeks, further rose to 3092 on Saturday last; 442 new cases were admitted during the week, against 391, 405, and 440 in the three preceding weeks. These hospitals also contained on Saturday last 1039 cases of diphtheria, 286 of whooping-cough, 61 of measles, and 41 of enteric fever, but not one of small-pox. The 1148 deaths from all causes in London were 103 more than the previous number, and corresponded to an annual death-rate of 13·3 per 1000. The deaths referred to diseases of the respiratory system, which had been 143, 163, and 144 in the three preceding weeks, fell to 126 in the week under notice, and were equal to the number in the corresponding week of last year.

Of the 4421 deaths from all causes in the 97 towns, 192 resulted from different forms of violence and 363 were the subject of coroners' inquests. The causes of 33, or 0·7 per cent., of the total deaths were not certified either by a registered medical practitioner or by a coroner after inquest. All the causes of death were duly certified in London, Portsmouth, Bristol, Leicester, Nottingham, Salford, Bradford, Leeds, Newcastle-on-Tyne, and in 69 other smaller towns. Of the 33 uncertified causes of death, 5 were registered in Liverpool, and 3 each in Birmingham and in Darlington.

HEALTH OF SCOTCH TOWNS.

In the 16 largest Scotch towns with an aggregate population estimated at 2,293,200 persons at the middle of this year, 1216 births and 621 deaths were registered during the week ended Saturday, July 4th. The annual rate of mortality in these towns, which had been 14·4, 14·6, and 13·8 per 1000 in the three preceding weeks, rose to 14·1 per 1000 in the week under notice. During the thirteen weeks of last quarter the mean annual death-rate in these towns averaged 15·5, against a corresponding rate of 13·8 per 1000 in the 97 large English towns. Among the several towns the death-rate last week ranged from 3·1 in Falkirk, 9·7 in Paisley, 12·1 in Coatbridge, and 12·2 in Edinburgh, to 15·2 in Glasgow, 15·7 in Ayr, 18·0 in Aberdeen, and 20·3 in Hamilton.

The 621 deaths from all causes were 16 more than the number in the previous week, and included 41 which were referred to the principal epidemic diseases, against 67 and 52 in the two preceding weeks. Of these 41 deaths, 13 resulted from infantile diarrhœal diseases, 12 from whooping-cough, 9 from measles, 5 from diphtheria, and 1 each from scarlet fever and enteric fever. The mean annual death-rate from these diseases was equal to 0·9 per 1000, or 0·4 less than the rate recorded in the 97 large English towns. The deaths attributed to infantile diarrhœal diseases, which had been 10, 21, and 10 in the three preceding weeks, rose to 13 during the week under notice, and included 4 in Glasgow, 3 in Hamilton, and 2 in Aberdeen. The fatal cases of whooping-cough, which had been 15, 20, and 18 in the three preceding weeks, fell to 12 last week and included 10 in Glasgow. The deaths from measles, which had been 12, 17, and 7 in the three preceding weeks, rose to 9 last week; 4 of these were registered in Glasgow and 3 in Dundee. The deaths from diphtheria, which had been 2, 6, and 8 in the three preceding weeks, fell to 5 last week and included 3 in Glasgow. The fatal case of scarlet fever was registered in Motherwell, and that of enteric fever in Glasgow.

The deaths referred to diseases of the respiratory system, which had been 95, 77, and 64 in the three preceding weeks, were 63 last week; 33 deaths were referred to different forms of violence, against 24 and 26 in the two preceding weeks.

HEALTH OF IRISH TOWNS.

In the 27 town districts of Ireland, with an aggregate population estimated at 1,205,280 persons at the middle of this year, 615 births and 375 deaths were registered during the week ended Saturday, July 4th. The annual rate of mortality in these towns, which had been 17·9, 17·7, and 15·7 in the three preceding weeks, rose to 16·2 per 1000 in the week under notice. During the 13 weeks of last quarter the mean annual death-rate in these towns averaged 19·0 per 1000; in the 97 large English towns the corresponding rate did not exceed 13·8, while in the 16 Scotch towns it was equal to 15·5 per 1000. The annual death-rate in the week under notice was equal to 16·3 in Dublin (against 13·3 in London and 15·2 in Glasgow), 17·0 in Belfast, 20·4 in Cork, 14·0 in Londonderry, 20·3 in Limerick, and 9·5 in Waterford, while in the 21 smaller towns the mean rate was 13·7 per 1000.

The 375 deaths from all causes were 11 below the number in the previous week, and included 47 which were referred to the principal epidemic diseases, against 50 and 36 in the two preceding weeks. Of these 47 deaths, 15 resulted from measles, 14 from infantile diarrhœal diseases, 10 from whooping-cough, 4 from diphtheria, 3 from scarlet fever, and 1 from enteric fever, but not one from small-pox. The mean annual death-rate from these diseases was equal to 2·1 per 1000, against 1·3 and 0·9 per 1000 in the English and Scotch towns respectively. The deaths attributed to infantile diarrhœal diseases, which had been 10, 15, and 11 in the three preceding weeks, rose to 14 last week, and included 7 in Belfast, 4 in Dublin, and 2 in Cork. The fatal cases of measles, which had been 16, 19, and 13 in the three preceding weeks, rose to 15 last week, and included 9 in Belfast and 2 each in Dublin and in Lurgan. The deaths referred to whooping-cough, which had been 8, 3, and 6 in the three preceding weeks, rose to 10 last week; 7 of these 10 deaths were registered in Belfast and 2 in Cork. The fatal cases of diphtheria, which had been 1, 2, and 2 in the three preceding weeks, rose to 4 last week, and included 2 in Dublin. The 3 deaths from scarlet fever, 2 of which occurred in Belfast, were slightly below the average for recent weeks. The death ascribed to enteric fever was certified as "paratyphoid" and occurred in Dublin.

The deaths referred to diseases of the respiratory system, which had been 67, 68, and 57 in the three preceding weeks, were 41 in the week under notice. Of the 375 deaths from all causes, 110, or 29 per cent., occurred in public institutions and 7 resulted from various forms of violence. The causes of 17, or 4·5 per cent., of the total deaths were not certified either by a registered medical practitioner or by a coroner after inquest; in the 97 large English towns the proportion of uncertified deaths did not exceed 0·7 per cent.

THE SERVICES.

ROYAL NAVY MEDICAL SERVICE.

THE following appointments have been notified:—Staff-Surgeons: P. D. M. Campbell to the *Wildfire*, additional, for disposal; and F. G. Wilson to the *Victory*, additional, for disposal.

ARMY MEDICAL SERVICE.

Colonel Harry S. McGill, from the Half-pay List, retires on retired pay (dated July 8th, 1914). Colonel Thomas J. O'Donnell, D.S.O., *on completion of four years' service in his rank, is placed on the Half-pay List* (dated July 7th, 1914). Brevet-Colonel Samuel Hickson, Honorary Surgeon to the King, from the Royal Army Medical Corps, to be Colonel, vice T. J. O'Donnell, D.S.O., to half pay (dated July 7th, 1914).

ROYAL ARMY MEDICAL CORPS.

Major John Hennessy to be Lieutenant-Colonel (dated July 7th, 1914).

Captain William W. Boyce, *from the half-pay list*, is restored to the establishment (dated June 29th, 1914).

Colonel S. Hickson has taken up duty at the Horse Guards as Inspector of Medical Services on the staff of the Inspector-General of the Forces.

Lieutenant-Colonel T. du B. Whaite has been transferred from Woolwich to the Military *Hospital at Lahore* as Senior Medical Officer. Lieutenant-*Colonel J. C. O'Connor* has been *appointed* Deputy Assistant *Director of* Medical Services to the Irish *Command* Headquarters Staff. Lieutenant-Colonel J. H. *Daly* has been appointed to hold charge of the Military Hospital at Belfast. Lieutenant-Colonel G. Cree has taken up duty as *Assistant* Director of Medical Services at *Bordon*. Lieutenant-*Colonel* G. A. T. Bray has been appointed *Deputy Surgeon* to the Royal Hospital at Chelsea. Lieutenant-Colonel O. L. Robinson has taken up duty as *Professor of Tropical* Medicine at the Royal Army Medical College, *Grosvenor-road*. Lieutenant-Colonel T. McCulloch has been appointed to hold charge of the Medical Division and Sanatorium at the Royal Victoria Hospital, Netley. Lieutenant-Colonel *D. M. O'Callaghan* has been placed under *orders* for service abroad during the coming trooping season. Lieutenant-Colonel F. Smith, D.S.O., has been appointed Medical Inspector of Recruits to the Irish Command Headquarters Staff. Lieutenant-Colonel B. B. Scott has taken up duty in the London District.

Major D. L. *Harding* has been appointed to hold charge of the Military Hospital at Mullingar. Major H. W. [illegible] has taken up duty at *Netheravon*. Major M. H. G. Fell has been appointed Deputy *Assistant* Director of Medical Services, Aldershot Command. Major J. G. Gill has been [illegible] to the *Southern Command*. Major R. L. Popham has been transferred from the Cork District to the Military Hospital at Nowshera Cantonment. Major F. E. Gunter has been appointed to hold medical charge of the Cadets at the Royal Military College, Sandhurst, on transfer from [illegible]

Major J. Matthews has arrived home for duty from the Ninth (Secunderabad) Division. Major W. Davis has taken up duty at Naini Tal. Major A. G. Thompson has been appointed to the Southern Command. Major G. J. A. Ormsby has arrived home for duty from Meerut Cantonment. Major J. L. Jones has been transferred from the Military Hospital at Calicut Cantonment to Wellington Sanatorium. Major J. F. Martin has been appointed to the Aldershot Command. Major J. C. Kennedy has been appointed to the Military Hospital at Lebong Cantonment on transfer from Lucknow. Major H. G. Pinches has been appointed to the Military Hospital at Sheerness. Major R. McK. Skinner has been transferred from the Curragh Camp to the Military Hospital at Lahore. Major H. S. Thurston has been placed under orders for service abroad during the coming trooping season. Major W. J. P. Adye-Curran has been appointed Specialist in Advanced Operative Surgery to the Military Hospital at Cosham. Major T. H. M. Clarke, C.M.G., D.S.O., has taken over medical charge at the Royal Hibernian Military School, Phœnix Park, Dublin. Major W. J. S. Harvey has been appointed Company Officer to No. 29 Company, Royal Army Medical Corps at Jamaica. Major C. E. Fleming has been appointed to hold charge of the Military Families Hospital at Roberts's Heights, Pretoria. Major F. McLennan has been appointed Adjutant to the School of Instruction at Aberdeen. Major C. E. Pollock has joined for duty at Sierra Leone. Major F. S. Walker has been appointed to hold charge of the Military Hospital at Fort Camden. Major C. R. L. Ronayne has arrived home on leave of absence from Gibraltar. Major H. A. Bransbury has been granted six months' general leave of absence. Major E. P. Sewell has been appointed Specialist Sanitary Officer in Ceylon. Major W. Riach has been appointed Specialist in Ophthalmology to the Queen Alexandra Military Hospital at Grosvenor-road. Major H. S. Roch has been appointed to Pretoria.

Captain D. T. MacCarthy has been granted six months' leave of absence home from India with permission to revert to the Home Establishment at its expiration. Captain F. C. Lambert has been transferred from Pembroke Dock to the Military Hospital at Poona Cantonment. Captain R. G. S. Gregg has taken up duty at Aden on transfer from Karachi. Captain A. C. Amy has joined at Bury. Captain J. A. Anderson has been appointed to the Royal Army Medical College for the course of instruction for promotion to the rank of Major. Captain H. B. Kelly has been placed under orders for service abroad. Captain W. W. Browne has been appointed Specialist in the Prevention of Disease and placed in charge of the Bacteriological Research Laboratory at Ahmednagar. Captain H. Harding has been appointed to the Military Hospital at Warley. Captain V. C. Carruthers has been granted leave of absence for one month. Captain W. R. Galwey has been appointed Deputy Assistant Director of Medical Services (Sanitary Branch) to the Ninth (Secunderabad) Division. Captain J. H. Graham has taken up duty at Cosham. Captain W. Mitchell has been appointed to hold charge of the Military Hospital at Wrexham. Captain C. Scaife has arrived home for duty from India. Captain J. A. Manifold has been appointed to hold charge of the Military Hospital at Warwick Camp, Bermuda. Captain H. L. Howell has been appointed to hold charge of the Native Section Hospital at Kirkee Cantonment. Captain D. F. Mackenzie has been appointed Staff-Surgeon at Meerut. Captain C. H. Stringer has joined at Jamaica.

Lieutenant R. K. Mallam has been transferred from Bordon to the Second (Rawal Pindi) Division. Lieutenant W. McNaughtan has taken up duty at Quetta on transfer from the Royal Victoria Hospital at Netley. Lieutenant M. Burnett has embarked for India. Lieutenant J. H. M. Frobisher has been appointed to Lucknow Cantonment. Lieutenant W. B. Stevenson has been transferred from Deepcut to Rawal Pindi Cantonment. Lieutenant G. F. Allison has been appointed to the Military Hospital at York on transfer from Strensall. Lieutenant W. L. Webster has been transferred from Limerick to the Military Hospital at Cairo. Lieutenant D. T. Large has been appointed to the Fifth (Mhow) Division. Lieutenant R. W. Richardson has been appointed to the Military Hospital at Jubbulpore. Lieutenant E. B. Allnutt has been transferred from Poona Cantonment to the Military Hospital at Purandhur. Lieutenant A. G. Bigham has taken up duty at Rawal Pindi.

INDIAN MEDICAL SERVICE.

Lieutenant-Colonel M. A. Ker has been appointed to officiate as Assistant Director of Medical Services to the Derajat and Bannu Brigades, vice Colonel J. Crimmin, V.C., C.B., C.I.E., granted leave of absence. Lieutenant-Colonel L. F. Childe has taken up duty as Professor of Medicine and Therapeutics at the Grant Medical College, Bombay. Lieutenant-Colonel E. H. Wright has been appointed District Medical and Sanitary Officer and Superintendent of the Medical School at Tanjore. Lieutenant-Colonel H. E. Banatvala has been confirmed in the appointment of Inspector-General of Civil Hospitals and Prisons and Sanitary Commissioner to the Government of Assam. Lieutenant-Colonel G. M. C. Smith has taken up duty as Superintendent of the District Prison at Ludhiana. Lieutenant-Colonel E. P. Maynard, professor of ophthalmic surgery at the Medical College, Calcutta, has been granted six months' leave of absence home from India. Lieutenant-Colonel H. Fooks, medical officer of the 15th Lancers, has been appointed to officiate as Assistant Director of Medical Services to the Bombay Brigade, vice Colonel H. Hendley, granted seven months' leave of absence home from India.

Major C. Hudson, D.S.O., has taken over substantive medical charge of the 2nd Rajputs at Muscat. Major D. H. F. Cowin has joined at Patiala. The services of Major J. M. Woolley have been placed permanently at the disposal of the Government of Burma. Major E. A. C. Matthews has been appointed Honorary Surgeon to H.E. the Viceroy and Governor-General of the East Indies.

Captain C. H. Reinhold, civil surgeon at Bijnor, has been transferred. Captain W. J. Powell has joined at Kasauli. Captain G. A. Jolly, officiating civil surgeon at Fategarh, has been granted nine months' combined leave. Captain A. F. Babonau has joined at the Naga Hills District. Captain B. Higham has been appointed to hold medical charge of the Sind Rifles, vice Colonel B. B. Grayfoot, transferred. Captain H. B. Scott has been appointed Pathologist to the General Hospital at Rangoon, vice Captain A. Whitmore, granted leave of absence. Captain W. Gillit, superintendent of the Bhagalpur Central Prison, has been appointed to officiate as Civil Surgeon at Bhagalpur, vice Lieutenant-Colonel J. C. S. Vaughan, granted leave of absence. Captain I. D. Jones has been appointed Professor of Materia Medica at the Grant Medical College, Bombay.

Lieutenant N. C. Kapur has been appointed to hold medical charge of the 31st Mountain Battery and Frontier Garrison Artillery.

SPECIAL RESERVE OF OFFICERS.

Royal Army Medical Corps.

No. 18 Field Ambulance: Lieutenant-Colonel (Honorary Major in the Army) A. A. Watson, R.A.M.C. (T.), to be Lieutenant-Colonel (dated May 1st, 1914). Captain Wilson H. P. Hey resigns his commission (dated July 4th, 1914).

The under-mentioned to be Lieutenants (on probation):—Cadet Corporal William Siegfried Dawson, from the Oxford University Contingent, Officers Training Corps (dated May 20th, 1914). Cadet Griffith Ivor Evans, from the Oxford University Contingent, Officers Training Corps (dated May 20th, 1914). Cadet Sergeant Thomas William Clarke, from the Edinburgh University Contingent, Officers Training Corps (dated May 26th, 1914). Cadet Sergeant John Culleuan, from the Belfast University Contingent, Officers Training Corps (dated June 4th, 1914). Cadet Arthur George Fisher, from the Dublin University Contingent, Officers Training Corps (dated June 5th, 1914).

TERRITORIAL FORCE.

Royal Army Medical Corps.

Highland Mounted Brigade Field Ambulance, Royal Army Medical Corps: John Broadfoot to be Lieutenant (dated May 1st, 1914).

3rd East Lancashire Field Ambulance, Royal Army Medical Corps: Captain Wilson H. P. Hey resigns his commission (dated July 4th, 1914).

Attached to Units other than Medical Units.—Lieutenant-Colonel (Honorary Major in the Army) Andrew A. Watson is seconded for service with No. 18 Field Ambulance, Royal Army Medical Corps (Special Reserve) (dated May 1st, 1914). Captain Samuel M. Sloan to be Major (dated May 22nd, 1914). Captain John Orr resigns his commission, and is granted permission to retain his rank and to wear the prescribed uniform (dated July 4th, 1914).

Supernumerary for Service with the Officers Training Corps.—Lieutenant Patrick Nicol, serving with the Aberdeen University Contingent, Senior Division, Officers Training Corps, resigns his commission (dated July 4th, 1914).

ST. JOHN AMBULANCE BRIGADE.

On July 4th 1500 members of the Prince of Wales's Corps of the St. John Ambulance Brigade paraded in Hyde Park for their annual inspection. Surgeon-General Sir Arthur W. May, Director-General of the Medical Department of the Royal Navy, presented the trophies and long service medals

Surgeon-General G. J. H. Evatt, C.B., will give an address to the St. Marylebone Red Cross Camp at Eastcott Hall, on July 12th (Sunday), at 7 P.M., on "The Real Florence Nightingale."

Home and Foreign Notes.

(FROM OUR OWN CORRESPONDENTS.)

LIVERPOOL.

The University of Liverpool.

THE Chancellor of the University (the Earl of Derby) presided at a special congregation held on Saturday, July 4th, in St. George's Hall, when degrees were conferred on the successful students in the recent examinations. The Vice-Chancellor (Sir Alfred Dale) announced the appointments to fellowships and studentships and the names of the prize-winners, and then closed the proceedings with the Latin formula of dismissal. Mr. Keith W. Monsarrat has resigned the post of Dean of the Faculty of Medicine, and Professor J. M. Beattie has been nominated in his place.

National Association for the Prevention of Infant Mortality Conference.

The National Association for the Prevention of Infant Mortality and for the Welfare of Infancy held its annual conference in Liverpool on July 2nd and 3rd. Mr. Herbert Samuel, the President of the Local Government Board, was to have delivered the inaugural address, but was detained in London. He sent a letter in which he said it had been a great satisfaction to him to see the remarkable reduction that had taken place in the rate of infant mortality during the last few years, and that whatever assistance the Local Government Board could render to the great object the association had in view would be gladly given. In the absence of Mr. Samuel, the opening address to the conference was delivered by Mr. J. Herbert Lewis, Parliamentary Secretary to the Board, who laid stress upon the value of coöperation between public and voluntary bodies in tackling the problem of infant welfare. The official work, central and local, of the country, he said, was changing. The day of stiff official starch was past. They needed and had something more pliable, more human, and something more touched with the spirit and needs of the common people, with none of the meretricious superiority of a mere narrow bureaucracy. Many interesting papers were read subsequently. Among the most interesting were those of Dr. A. K. Chalmers on Ante-natal Hygiene; Dr. Eric L. Pritchard on the Scope and Functions of Schools for Mothers; Dr. E. W. Hope on the Aims, Objects, and Methods of Sterilisation of Milk; and Dr. C. W. Saleeby on the Nurture of the Race.

Appointment for Professor B. Moore.

The Liverpool University is about to lose the services of Professor Benjamin Moore, whose important appointment at the new National Health Laboratory has already been noted in your columns. There will be three sections in the laboratory. One will be concerned with bacteriology, the second with experimental physiology, while the third will embrace applied physiology and hygiene. Professor Moore will be attached to the third of these, and he will have as his colleague Dr. Leonard Hill. For 12 years Professor Moore has occupied the Johnston chair of biochemistry at the Liverpool University, and for some time he was dean of the medical faculty. He became especially prominent during the time of the Insurance Bill controversy, when he was the chief advocate of a State medical service. To the Liverpool University the value of his work is impossible adequately to estimate, and the council have received the intimation of his resignation with regret, coupled with good wishes for success in his important Government work in London. By the resignation of Professor Moore another chair in the medical faculty is rendered vacant, no one as yet having been appointed to the chair of physiology to succeed Professor C. S. Sherrington, who earlier this year went to Oxford.

After-care of School Children.

In THE LANCET of June 6th, p. 1641, a reference was made to a decision of the Liverpool education committee to transfer the following up of ailments of school children from the medical department to that of the director of education. These proposals, however, were not pursued, and were withdrawn by the chairman of the education committee from consideration by the city council. The matter therefore remains as before in the medical department.

Measles in Liverpool.

Owing to the large number of cases of measles among the younger children in the city the medical officer of health, Dr. E. W. Hope, has ordered the closing of the infant departments in all the schools in Liverpool. The officials of the health department expect that the closing of the schools for a fortnight and the holiday period of five weeks which will then ensue will have the desired effect of checking the outbreak. The present temperate weather is also a factor in stopping the spread of the disease.

St. Paul's Eye Hospital.

The annual meeting of the St. Paul's Eye Hospital was recently held at the town hall. The Lord Mayor presided, and moved the adoption of the report and balance sheet, the latter of which showed a carried forward deficit of £737. The St. Paul's Hospital recognised that prevention was more important than cure, and in this connexion he mentioned that one of the most prolific causes of blindness was ophthalmia neonatorum. The hospital had done much to prevent this class of blindness. There were other diseases of the eye which did not produce blindness, but which produced so much incapacity that it almost amounted to blindness, and it was in respect to these other diseases that the hospital had given so much assistance. He was sorry, under these circumstances, that the needs of the hospital had not been fully met by the subscription list, and that there was a serious deficiency. When the valuable work of the institution had been more fully recognised he trusted that the public would realise that it well deserved their support in their own interests as well as in the interests of humanity. Mr. C. S. Rigg seconded, and the report was adopted. Sir William Bowring and Dr. E. Stevenson proposed the re-election of the committee, and votes of thanks were accorded to the ladies' committee and the medical staff.

July 7th.

SCOTLAND.

Health of Edinburgh.

IN the report of the medical officer of health for this city (Dr. A. M. Williamson) for the year 1913, which has recently been issued, the death-rate of the city is the lowest ever recorded, and in this respect now compares most favourably with other large centres of population. Dr. Williamson directs special attention to the spread of cancer, compares its incidence and death-rate with those of tuberculosis, and deplores the comparatively slight attention paid to the former condition compared to the latter.

Honorary Degrees at Edinburgh University.

The summer graduation ceremony took place on July 3rd in the M'Ewan Hall, under the presidency of Sir William Turner, Vice-Chancellor of the University. The hall was filled in every part. Among the 13 recipients of honorary degrees were Dr. Byrom Bramwell, consulting physician to the Edinburgh Royal Infirmary, and Dr. F. W. Mott, pathologist of the London County Asylums. Professor James Mackintosh, dean of the Faculty of Laws, in presenting Dr. Bramwell and Dr. Mott for the degree of Doctor of Laws, referred to the former's rare acumen in diagnosis and sympathetic attitude to every advance in medical thought and practice, and to the latter's acknowledged leadership of medical opinion in the great and growing department of psychiatry, and in particular in the subject which he had made peculiarly his own—the pathology of the brain and mental disease.

The Royal Visit to Glasgow.

The King and Queen had an enthusiastic reception at Glasgow on July 7th. His Majesty first opened the Diamond Jubilee Memorial block at the Royal Infirmary, which has cost £500,000, and passed through some of the wards. He was much interested in the Lister relics which are preserved at the infirmary. In the afternoon Their Majesties visited the newly rebuilt Royal Hospital for Sick Children, and paid a brief call at the Western Infirmary.

The Drug Fund in Kincardineshire.

While the chemists in Aberdeenshire and in the city of Aberdeen have been in the unfortunate position of having deductions made from their drug accounts, their brethren in the adjoining county of Kincardineshire are more fortunate. Their accounts are not only to be paid in full, but in addition they are to receive a substantial bonus amounting approximately to 39 per cent. of the chemists' accounts.

July 7th.

IRELAND.

The Working of the National Insurance Act in Ireland.

IN the annual report on the working of the National Insurance Act just issued the statement is made that "the administration of benefits by societies in Ireland has been very satisfactory. The societies have shown a desire to deal with applications for benefit in as sympathetic a manner as possible consistent with their duties to their members as a whole." This represents an unduly optimistic view of the facts. While some societies are acting as the report states, others, including some of the largest and most important, place every obstacle in the way of a member obtaining his benefit. In some cases no medical certificate is accepted except that of the society's medical officer, and if a dissatisfied member wishes to appeal to a committee of complaints he must first lodge the sum of £1, which it is almost invariably impossible for him to do. Discontent is gradually growing, and boards of guardians throughout the country are complaining that sick people entitled to benefit are falling on the rates. The Athlone guardians, for instance, at their last meeting unanimously passed a resolution asking the Insurance Commissioners to dispense with the services of the "medical adviser" in their district.

Public Health Administration of Dublin.

Sir Charles Cameron, superintendent medical officer of health of Dublin, has issued a "Brief History of Municipal Public Health Administration in Dublin," which he has dedicated "to the corporation of that ancient city." The book includes a brief historical sketch of the evolution of sanitation in Dublin, and is also a reply to the recent report of the Departmental Committee on the Housing of the Working Classes in the city. As a historical sketch it furnishes a good deal of interesting information not easily accessible elsewhere. As a reply to the Departmental Committee the work is less satisfactory. The gravamen of the strictures on the work of the Dublin corporation lay in the charges (1) that they had failed to make full use of their existing powers; (2) that the officers of the corporation had failed to carry out the by-laws concerning tenement houses; and in particular (3) that rebates of taxes had been granted on property classified in the corporation books as "unfit for human habitation." The Departmental Committee gave full particulars of the failure of the corporation to exercise its powers, as, for instance, in its neglect to prepare and keep a register of tenements. To quote the work done by the corporation as regards water-supply, main drainage, and electric lighting, for which full credit should be given, is no answer to the charges. With regard to the second point Sir Charles Cameron admits the facts, but maintains that a rigid enforcement of the by-laws was impracticable. If the by-laws are unsuitable they should be amended rather than their habitual breach connived at. To the third point he makes no reply beyond discussing the details of one particular case.

Politics and Public Health in Belfast.

The medical officer of health reports that in the city of Belfast there are 934 houses occupied by more than one tenant, the inhabitants of these houses numbering 5073, and of these double-tenancy houses 535 are in one Parliamentary division. There can be no question that a number of these double-tenancy houses are manufactured to make Parliamentary votes. In cases where in such houses there is not access to proper sanitary conveniences it is the duty of the public health authorities to prosecute.

The Medical Officer of Health of Derry.

Dr. F. W. Craig has been appointed medical superintendent officer of health for the city of Derry, at a salary of £350 a year, and also tuberculosis officer, with a salary of £200 per annum.

A Grant to County Antrim Infirmary.

The county council of Antrim, after considerable discussion, decided on July 3rd, by a majority of one 8 to 7), to grant a supplemental contribution

of £100 for the year ending April 30th, 1914, towards the maintenance of the County Infirmary, Lisburn.

Water Famine in Dungannon.

Owing to the comparatively dry winter and summer many places in the north of Ireland are suffering from the prolonged drought, and among them is the old town of Dungannon, County Tyrone. Since July 5th the supply of water has been diminished to three hours in the morning and two and a half in the afternoon. The present supply, which was inaugurated 35 years ago, is totally unfit for the requirements of the residents of Dungannon.

July 7th.

PARIS.

Child Mortality and Alcoholism in Paris.

M. Paul Juillerat, a member of the Conseil d'Hygiène et de Salubrité de la Seine, and M. A. Filassier, head of the Statistical Department of the City of Paris, have published in the *Revue Philanthropique* the results of their researches on the causes of child mortality in Paris. Their work demonstrates forcibly the disastrous results of alcoholism. During the ten years 1903 to 1912 inclusive, out of 97,885 dead children, 53,619, or over half, were under 1 year. "Congenital debility" accounts for 12,342 of these deaths. Notwithstanding the difficulty in the present state of statistics of obtaining actual data in this matter, M. Juillerat and M. Filassier do not hesitate to attribute to alcoholism in the parents this enormous proportion of children affected with congenital debility. Interesting figures have also been furnished by Juquellier, Bourneville, and Magnan. Dr. Jacquet's statistics are also especially instructive. In the inquiry made by him between May 1st, 1912, and May 1st, 1913, at the Hôpital St. Antoine, he divided into the following three classes 396 patients examined by him who had a total of 879 children: (1) Moderate users of alcohol—those who drink habitually a litre of wine, alcoholic drinks, or occasional apéritifs—141 individuals, 305 births, 83 deaths; (2) excessive drinkers—those who drink habitually from 1½ to 2 litres of wine, alcoholic drinks, or frequent absinthes—108 individuals, 248 births, 115 deaths; (3) very excessive drinkers—those who drink habitually 2 litres or more of wine, apéritifs, and alcoholic drinks or absinthe usually and in abundance—147 individuals, 326 births, 244 deaths. This total of 396 individuals thus shows 879 children, of whom 442 died, 272 of them in infancy. Thus the progeny of these 396 parents, all alcoholic and more or less gravely toxic, shows a mean mortality of 50·28 per cent. M. Juillerat and M. Filassier further show that in different regions social or medical prevision has notably diminished the child mortality from diphtheria, pulmonary tuberculosis, tuberculous meningitis, syphilis, diarrhœa, and so forth. On the other hand, as regards congenital debility, which furnishes so considerable a proportion to these gloomy statistics, there has been practically no improvement.

The Paris Water-supply.

The present tropical heat, as in previous years, has aroused uneasiness on the drinking-water question. The temperature in Paris has reached 87·6° F. (32° C.) in the shade, and at once the use of water, which is ordinarily about 300,000 cubic metres daily, and which has even reached 400,000 cubic metres on occasion, jumped to 425,000. The *normal provision of source* water for the city o *Paris in the month of* July is from 310,000 to 320,000 *cubic metres. Beyond* this amount river water *filtered in sand-beds* at St. Maur and Ivry and *then passed* through an ozonising plant is used. *This source* can supply from 140,000 to 180,000 *cubic metres* of filtered water, giving a total *supply* of from 450,000 to 500,000 cubic metres *for* the daily use of the capital. In the future the supply from the sources of Provins, a scheme for which is now before Parliament, will furnish a daily supplement of 70,000 cubic metres, and work is at present going on to double the capacity of the filter beds at Ivry, which will then furnish 120,000 cubic metres instead of 60,000. The present time, however, is the most critical, for from July 14th an important proportion of the population leaves the city for the country or abroad. It is thought, therefore, that it will not be necessary hereafter to utilise unfiltered river water with the recommendation, which causes uneasiness, to the residents always to boil their water. The water from the filter beds is as safe as that from the source, though perhaps a little less fresh.

A Conference on Pellagra.

Dr. L. W. Sambon, of London, delivered a lecture at the Institut Pasteur on his theory as to the causation of pellagra, which, in his opinion, does not result, as has hitherto been thought, from the too exclusive use of spoiled maize, but is due to inoculation of the virus by the bite of the simulium fly. He also made a communication on the same subject to the Académie de Médecine.

July 6th.

AUSTRALIA.

Small-pox in Sydney.

CASES of small-pox still continue to occur in Sydney and suburbs at the rate of three to five cases daily, and the mild character of the disease has not been altered. As a result of public feeling in the matter of the refusal of the New South Wales Board of Public Health to isolate contacts, a conference was held in Melbourne and an agreement between the State and Federal authorities was arrived at under which the former were to have the use of the North Head quarantine for isolating dangerous contacts, but would vacate it if required on 24 hours' notice. Very little public interest is taken in the matter apart from the dispute between the authorities. A small epidemic has occurred at Bunbury, Western Australia, from a case introduced oversea from the East.

Remarkable Endurance.

Some time ago it was mentioned in this column that a young woman had given birth to a child on an excursion steamer in Hobson's Bay. The child died the next day, and the mother was recently prosecuted on a charge of concealment of birth. Evidence showed that the steamer left Port Melbourne early in the morning and about half an hour after departure the body of a living child was found in the lavatory. The steamer proceeded to Geelong and thence to Mornington, arriving at the latter place about midday. It was not till the arrival here that the mother was apprehended by a police constable who had taxed her with being the mother of the infant. Up to that time she had been sitting unconcernedly on deck with a young man. At the trial it was stated that this young man er. The jury found her not

ourne Medical School.

eing made in the public press for
the medical school of the Melbourne
it is said that accommodation is in-
nd that the professors are without
ssistance. A proposal has recently been
ransfer the school of anatomy to the new
s of the Melbourne Hospital, but it is
y that the authorities will fall in with such
ea.

Clinical Research.

Mr. J. S. Horsfall has promised a sum of £500 for ive years towards the establishment of chairs of clinical research in the Melbourne University. A small group of medical men have promised jointly another £500 per annum for the same term. At present the proposal is to divide this sum among the pathological departments of the three Melbourne teaching hospitals.

"The Battle of the Lodges."

The Victorian Branch of the British Medical Association has not yet included any new arrangements with the Friendly Societies. The organisation committee, acting upon the advice of Dr. J. A. Macdonald, who recently visited Australia, has been engaged in creating a defence fund to re-imburse practitioners who might lose appointments in the event of any open rupture. This fund at latest publication amounted to about £5000. Meanwhile nothing has been done beyond arranging a conference between the branch and the societies. As matters stand the Friendly Societies are willing to increase the rates of contract work but will not listen to any wage-limit proposal for membership. In New South Wales the lodges have in some instances held out against the local profession. It is quite possible that some movement may be made to endeavour to bring the dispute under the jurisdiction of the Commonwealth Arbitration Court.

Cancer Research.

At a recent meeting of the Victorian Board of Public Health a resolution was carried requesting other State boards to join in asking the Federal Government to provide a sum of £50,000 to be devoted to cancer research on condition that an additional £50,000 was subscribed by the public. The council of the Melbourne University have instituted a cancer research scholarship which will date for three years from August 1st, 1914. The scholar appointed must proceed to Europe and America, and return to the Melbourne Hospital by 1915. He is to receive a salary of £250 per annum and £100 for expenses.

Baby Bonus.

The Federal Treasurer, Sir John Forrest, made a statement in the Federal House that under the maternity bonus scheme a sum of £1,032,000 had already been paid away. The scheme was introduced in October, 1912, and was estimated to cost £400,000 per annum, but the estimate has been considerably exceeded.

Housing Commission.

The Victorian Government has appointed a commission to inquire into the housing conditions of the city of Melbourne. Evidence has been given by several police officers in the more crowded suburbs and although some undesirable arrangements were noted it cannot be said that any deplorable conditions have yet been disclosed.

Health of Adelaide.

The population of the city was estimated at 42,828, an increase of 305 for the year. The death-rate is given as 14·42 and infantile mortality figure at 63. Diphtheria was prevalent, 458 cases being reported, of which 293 were brought to Adelaide Hospital from outside districts. During the year 23 houses were condemned as unfit for habitation, and 18 ordered to be demolished. 1309 notices to repair dwellings were issued.

Venereal Prophylaxis.

A lay deputation accompanied by several medical men waited on the Premier of Victoria to urge that the Government should take measures for the provision of treatment of venereal disease and for the diffusion of information upon the subject. Mr. Watt expressed sympathy with the aims, and promised to continue the subsidy already paid for the provision of free Wassermann tests at the University, and to forward the educational scheme as far as might be desirable. He also undertook to introduce legislation for the detention of prisoners suffering from venereal disease until they were cured. The West Australian Government has made special provision for the treatment of venereal cases in the general hospitals of that State.

June 2nd.

Obituary.

CHARLES TANFIELD VACHELL, M.D. LOND., J.P., V.D.,

CONSULTING PHYSICIAN TO KING EDWARD VII. HOSPITAL, CARDIFF.

WE regret to record the death on July 2nd of Dr. C. T. Vachell, one of the most prominent medical practitioners at Cardiff and a leading public man in the life of the district. He had been seriously ill for some little time and was under treatment at Clifton when he died.

Charles Tanfield Vachell was born at Cardiff in 1848. He was the eldest son of John William Vachell, whose father had been twice mayor of Cardiff. He matriculated in the University of London from Hereford Cathedral School, and entered at King's College, London, in 1865, afterwards studying medicine at King's College Hospital. He qualified M.R.C.S. Eng. in 1869, and in the following year he obtained the M.B. degree of his University as well as the licences of the Royal College of Physicians of London and of the Society of Apothecaries. In 1874 he proceeded to the M.D. degree.

Dr. Vachell's long and successful association with the Cardiff Infirmary (now King Edward VII. Hospital) began almost immediately after he became qualified. The institution was then known as the Glamorgan and Monmouthshire Infirmary and Dispensary. In 1870 he was appointed house surgeon, and in 1879 he was made medical officer to out-patients. From 1882 to 1902 he served upon the active visiting staff first as surgeon, later as physician, and was appointed to the consulting staff 12 years ago. He was the joint founder 30 years ago of the Cardiff Provident Dispensary, and served with zeal and ability upon a number of public bodies and committees. Dr. Vachell was also for a considerable period a keen Volunteer, and retired from the Glamorgan Volunteer Artillery after 22 years' service with the rank of surgeon-lieutenant-colonel and the V.D. decoration. He was very well known locally as an antiquarian and naturalist, taking a prominent part in the establishment of the National Museum of Wales and for many years keeping a daily record of the rainfall in the district.

Among Dr. Vachell's occasional contributions to medical literature were three papers which appeared in THE LANCET—Cystic Goitre Treated by Shelling Out, in 1886; Acute Nephritis from Sewer Air Poisoning, in 1894; and Notes of a Case of Ether-Pneumonia, in 1898. He had an extensive practice among the leading families of Cardiff and its neighbourhood, and his opinion and character were much valued by his professional colleagues.

Mr. P. Rhys Griffiths, senior surgeon to the King Edward VII. Hospital and chairman of the medical board, writes: "Dr. Vachell was a most accomplished officer and throughout his life rendered distinguished service to the hospital. In the affairs of the British Medical Association he always took a warm and active interest. He had been president of the South Wales and Monmouthshire Branch and of the Cardiff Division. He was foremost in the fight against the Insurance Act. A past president, he was a frequent contributor of papers to the Cardiff Medical Society, and until recently took an active interest in its discussions. Hanging on the walls of the society's rooms is a series of photographs illustrating some of Dr. Vachell's pioneer work in the surgery of the thyroid. He was justly regarded by a large circle of patients as a steadfast friend and trusted adviser. The wide range of his interests was very notable. His leading characteristics were an unbounded and infective enthusiasm—inexhaustible capacity for work—great kindness, sympathy, and generosity. He was a man of strong personality and striking presence. His was essentially a full life. His skilful, devoted, and kindly services to the poor, his readiness at all times to help his colleagues with his wise counsel, and his unswerving loyalty will always be remembered with affection and esteem."

Dr. Vachell married, in 1877, Winifred, daughter of the Rev. J. W. Evans, rector of Cossey, who, with one son and two daughters, survives him. His brother, Dr. Herbert R. Vachell, is also a well-known Cardiff practitioner and a member of the consulting staff of the King Edward VII. Hospital.

SEVENTH INTERNATIONAL CONGRESS *FOR* OBSTETRICS AND GYNÆCOLOGY.—*This congress* will meet in New York from Sept. 13th to 17th, 1915, under the presidency of Dr. J. Riddle Goffe, of New York. An executive committee has been appointed for each country that has hitherto participated actively in the proceedings of the several congresses to select reporters on the fixed subjects, and *to recommend to the programme committee* the names of other suitable persons *to represent* their respective countries. There will be *one scientific* session each day, from 9 A.M. to 1 P.M. The afternoons will be devoted to clinics, sightseeing, excursions, &c. The scientific programme will include: The Remote Results of Operations for the Relief of Retro-displacements of the Uterus, both Simple and Complicated; reporter, Professor Th. H. Van der Velde, Haarlem, Holland. The Treatment of *Puerperal* Infections; reporter, Dr. Edward P. Davis, Philadelphia, Pa., *U.S.A.* The Value *of* Radio-activity in Gynæcological Therapeutics by (1) Roentgen Ray, (2) Radium, and (3) Mesothorium may be discussed in individual papers or in the form of reports. Friday, Sept. 17th, Miscellaneous Papers. National societies are invited to discuss these subjects at least eight months before the meeting *of* the congress, and *to have reporters* collect and digest these *discussions* and *report their* conclusions.

Correspondence.

"Audi alteram partem."

MINERS' PHTHISIS ON THE RAND.

To the Editor of THE LANCET.

SIR,—THE LANCET of April 11th contains two contributions by Mr. B. G. Brock and Mr. J. L. Aymard on the Miners' Phthisis question.

I am taking the liberty of examining some of their arguments as I feel sure that an absolutely impartial statement would be of interest to those who have read Mr. Aymard's effusion. My impartiality can be judged from the following. I have worked on the mines of the Rand for a period just exceeding three years, and have now given up mining owing to silicosis, and consequently am, according to Mr. Aymard, one of the victims sacrificed to Mammon by its High Priests, the Chamber of Mines. I have no money invested in the mines, and am not working for any of the mining houses, and I am not employed, nor do I so desire to be, by any of the benefit societies or unions, which being of strong labour sympathies can be said to represent Mr. Aymard's side of the question.

To take his letter seriatim. His first paragraph, I think, can be more or less ignored. When a man says that his "statements have never been proved incorrect," and that his "opponents are cursed with" "*damnable political insincerity*," I think, Sir, any fair-minded man understands that it is a political manifesto and not a scientific treatise that he is reading. In his next paragraph he first attacks "commission after commission" as "being packed with incompetent persons." Who is Mr. Aymard that he should set himself up as a judge of mining or medical experts? He then clinches his argument by saying that 2000 less men are employed to-day than in 1911. Let him be honest and say if this is really due to phthisis. I think any of the hundreds who are to-day walking the reef looking for work would be quite willing to convince Mr. Aymard that this shortage is the result of the late strikes and not of silicosis. A little further down, in relation to the deadly dust, Mr. Aymard, referring to the process of "collaring a hole," states that during this process "more frequently than not no water is used." In a later paragraph he again indulges in a little hyperbole at the expense of the mining houses, because, according to him, they are placing no limit on the number of machines a competent miner supervises. Now anyone who has had *any* experience of mining will agree that it is a very rare thing for a miner *to allow anybody but himself* to supervise the direction of a hole. *The* reason for this is that in *driving, for example,* a hole started ½ in. away from its proper *place may* easily spoil the whole day's work. *This is* the *period* when Mr. Aymard *says no* water is used.

The *following* observations on this water question *may be* of interest. A shift boss is bound by law to report any breach of regulations, the most stringent of these regulations being those with reference to prevention of phthisis. Now compare the treatment a shift boss gets from the management and from the men in this respect. The management generally employs a man who is known as manager's assistant, or some such title, whose main duties are to pay surprise visits. If he finds a man not using water when drilling his first question is, "Has your shift boss been here?" If the answer is in the affirmative the shift boss will be reported to the manager, and probably fined if not "fired." Now as to the men who are continually complaining about the "callous, inefficient administration," to quote from Mr. Brock, I can confidently affirm that out of an *average of nine developers* I had on my section when shift bossing, only two made proper use of the water the mine supplied. The reason they did not use the water is because they are willing to risk their own lives, and what they do not consider, the lives of the kaffirs working for them, and also of all persons in the direct air current from them, rather than get soaked through and run the chance of pneumonia. It was impossible to get evidence to convict as they generally place a boy—i.e., kaffir—to watch for the approach of any of the staff. My authority for these two statements is that I have been told by the men themselves that they do this.

I think I have shown so far that it is more owing to the men's abuse of precautions than to the management's lack of precautions that phthisis is still prevalent. Mr. Aymard's remark *re* breakdowns due to too great a pressure of water is so idiotic that I wonder he had the temerity to try to bluff so obviously. In fact, it is the rarest thing in the world to find a man working on machines who does not give as his excuse for not using water that "there is not enough pressure." To obviate this the Mines Department brought out the amended regulations, 1913, to compel the miners to have a pressure of water *over* a fixed minimum of 30 lb. to the square inch. I think this shows that it is not due to the use of water, but to its neglect by the men that this scourge is still prevalent. Owing to the fact that Mr. Aymard's advice *re* an expert on silicosis was not followed by the mining houses he asserts that the rule of these houses is that "no experts wanted from oversea except when required for political purposes." This is another example of the political manifesto. Can he answer for what political purpose did the houses bring out, at the expense of the mining industry, Sir Almroth Wright and Surgeon-General Gorgas, who, Mr. Aymard has said, "did not study the phthisis question properly." Your readers, Sir, can appreciate the fact that when men of their standing, with their staffs, are brought out, necessarily at great expense, defrayed entirely by the mining industry, Mr. Aymard's advice is not likely to be taken, or paid for.

In his paragraph referring to Mr. Moynihan's discoveries, he cheerfully states "that the question at what depth this," meaning the introduction of steam, "would be impracticable, if at all, remains to be seen." In the interview he states: "After blasting, a mine could easily, and comparatively cheaply, be filled with steam." What sublime confidence! Mr. Aymard ought to know that the upper levels of most of the mines are very nearly "worked out." The greater part of the work is now carried on from 2000 ft. to 4000 ft. below the surface, and development from 3000 ft. downwards. I leave it to your readers to ask any competent engineer for an estimate for conveying steam 3000 ft. down a wet shaft, then bringing it along drives at a temperature of, perhaps, 80° for a distance of half a mile, or may be more, and then discharging it at such a temperature that it will fill the mine *as steam!*

I would suggest that if any of your readers feel interested in this scheme they then look at the monthly reports of these mines and see how many mines would become unpayable if this experiment were tried. Then think of the number of unemployed there would be left. I refer to this steam idea as an experiment. Though Mr. Aymard is quite convinced that the mining houses are only using water in preference to steam through "false economy," he seems to have forgotten the furious tirades he favoured us with during the last few years on the false economy of not using *water.* The mineowners followed his advice as he then gave it, and in THE LANCET of April 11th of this year you can see the manner in which he shows his gratitude.

Now, Sir, as to the remedy. I give my ideas, as I consider that any person may be the lucky person to hit on the right solution. The only hope I see is to make it an offence for anyone not to use water, and on a second offence to remove the offender's blasting ticket. This would, of course mean a large reduction in the number of competent miners employed. This could be effected by the system of well-paid sectional shift bosses in charge of a number of working places. Under these you could have men placed on day's pay in charge of each place. These men would be responsible to the shift boss that work was carried out as he ordered; the shift boss to be solely reponsible for blasting. This would remove what I consider the curse of the present system—viz., a miner earning, say, from £40 to £150 per month being under the charge of a shift boss who is paid often as low as £30 per month. What a chance for bribery! As a general working rule I would suggest that the shift boss should be paid sufficiently to resist all temptation to bribery, and the man paid low enough to prevent his being able to afford in comfort to pay bribes or fines for not using water.

In my opinion it would also help if the compensation for first stage were materially increased, and that for third stage phthisis diminished to prevent what is often done now, an unfortunate sufferer "hanging on" till he gets the fatal stages, so as to leave more money to his family. It may be impossible to carry out these suggestions, and the advantages of them may be illusory. I hesitate to express a definite opinion in the face of the experts whom the mining industry are so continually consulting, as I feel that if I did I would only be adding myself to the category of the fools who rush in where angels fear to tread.

I am, Sir, yours faithfully,
PHILIP H. FRANKS, B.Sc. (Mining) Birm.

Johannesburg, May 11th, 1914.

THE PLEA FOR IMMEDIATE OPERATION IN APPENDICITIS.

To the Editor of THE LANCET.

SIR,—Will you permit me to write a few lines in reply to Mr. Edmund Owen's letter in THE LANCET of June 27th? I have said in a former letter that a surgeon can frequently give a correct opinion as to the pathological state of an appendix before its removal in an acute attack of appendicitis from a consideration of the history, symptoms, and local examination of a patient. Mr. Owen denied this. In a second letter I gave notes of cases in which this had been done. It does not assist to call this guess work; the cases to which others could be added represent facts, and it is not possible to ignore them. I do not claim any special skill in this matter; few surgeons are satisfied with the simple performance of the operation in an acute abdominal case. They do not refuse to do the operation because of any doubt which they may have as to the exact cause of the symptoms of urgency. They recognise that early operation is necessary, endeavour to form an opinion before doing it, and make careful notes of everything found in order to compare it with other cases and see why there was a difficulty in making the diagnosis in any particular case. It is not enough at the present day to record in an acute appendix attack that the appendix was "gangrenous." We want to know whether the gangrene was local or affected the whole of the appendix. We also want information as to the probable cause of the gangrene, whether this was secondary to a concretion, took place beyond a stricture as a result of over distension, the position of this stricture, &c. The state of the omentum and surrounding peritoneum, with the character of any exudation, must also be noted. It is not possible for anyone frequently engaged in this branch of surgery to fail to advance in his knowledge of the subject if he tries to work in this way. I think it is the right way in which to proceed, although Mr. Owen does not appear to regard such an attempt as likely to prove of practical use. The custom of "waiting to see" until the veil is lifted is not satisfactory either in politics or in surgery for the ultimate good of the nation. I have not contended that anyone can state the exact condition of the appendix in every case; indeed, I have given evidence to the contrary. My point is that the surgeon can tell in many patients, and I have no doubt the number of these will increase. I have shown that a correct diagnosis of the state of the appendix has a practical value to the individual. The story of the racing man who placed three horses in their correct order before a race has no bearing on the question, and I cannot agree that it is all a game of chance.

I am, Sir, yours faithfully,

July 3rd, 1914. WILLIAM H. BATTLE.

To the Editor of THE LANCET.

SIR,—In view of the recent correspondence in your columns the following case seems to me worth recording, as it shows so plainly the impossibility of differentiating between mild and grave conditions of the appendix, and the danger of delay.

A boy, aged 12, was brought on July 4th at 8 P.M. He had been running about as usual, but had complained of occasional abdominal pains, so his mother thought she had better bring him. The boy was thin and looked badly nourished. The temperature and pulse were normal, and he said he had no pain. The abdominal wall was loose and flaccid; no sign of muscles being *en garde;* no increased resistance; no tender point. The appendix could be easily palpated through the lax abdominal wall; it felt hard and large, but was not tender to light pressure or rolling. When pressed firmly it gave a slight shooting pain to left hypochondrium. I operated the next day, and up to the time of operation the condition was unchanged. The pelvis contained a large amount of free clear fluid. The appendix was congested on the outside and hard with an old adhesion from the meso to the iliac floor. Inside the appendix was tightly strictured at its proximal end, and was full of pus. At the distal end was a piece of iron wire curved with sharp ends, one of which had nearly penetrated the peritoneum, the distance between the two points being three-eighths of an inch.

I had no suspicion that there was serious mischief in this case, and cannot see how anyone could have diagnosed it.—I am, Sir, yours faithfully,

Watford, July 7th, 1914. J. C. BARKER.

THE SURPLUS FUNDS IN LONDON.

To the Editor of THE LANCET.

SIR,—If the Botha-like way in which the Caxton Hall meeting of last week was conducted is a sample of the methods of the new organisation which promoted it, it augurs ill for its future. For a chairman—not named in the notices calling the meeting and not elected by it—to announce that *he* is not going to allow amendments to the resolution he and his friends have drafted is as alien to the true spirit of trade unionism, which was invoked, as anything one can imagine. That my amendment, previously communicated to him, which embodied everything of moment in the resolution, but suggested arbitration as the most practical solution of the difficulties of money allocation, was, after a preconcocted show of fair play, despotically ruled "out of order" was the plainest proof that the men who are contending for a *pro rata* distribution have no confidence in the justice of their own claims. For the greatest number of the men on the London panel are men with small lists. Why on earth they should allow themselves to be led blindfold by the big-list men who, while pretending to speak for the whole body, openly announce their intention, if they can procure such a division of the "surplus," of pocketing the greater part of it themselves, passes my comprehension. Such a division means actual ruin to many a small-list man. Dr. Angus was allowed to speak in favour of a *pro rata* division; I was instantly forbidden even to allude to its unfairness. So "fair play and no favour" is *not* to be the motto of the new organisation. We small-list men have our contract rights if we will but be wise enough to stick to them. For 1913 the right of proceeding against the London Insurance Committee for breach of contract expires on the 11th inst. by the provisions of the Public Authorities' Protection Act of 1893. I have therefore, after patiently waiting to the last moment for the London Insurance Committee to do justice, commenced legal proceedings, which I shall certainly not drop unless some proposal as equitable as the one which my amendment suggested is accepted by the Government and carried into speedy execution.

The Commissioners, it appears, are now stultifying their own consents to other schemes by laying it down "on legal advice" that nothing but a *pro rata* distribution is allowable under the Regulations. The proposition that one clause in a set of regulations can be intended and made to govern a state of things wholly created by the violation of previous clauses of the same regulations is the "tallest" substitute for a legal argument that I have yet met with, and the legal "light" that evolved it, whoever he be, ought to return to school. Besides this, the subsections relied on refer to a doctor's "list" which has, to comply with the Regulations, to be made *after* assignment and to include assigned persons. No legal doctor's "list" therefore exists in London, which again prevents the application of these clauses to the existing facts. If any attempt is made to apply these clauses to the distribution of the "surplus" it can be easily stopped by an appeal to the courts for an injunction, which I should at once make. Nothing but fresh legislation, such as submitting the whole question to arbitration, can solve the problem.—I am, Sir, yours faithfully,

Paddington Green, W., July 6th, 1914. H. BAZETT.

THE NATIONAL MEDICAL UNION.

To the Editor of THE LANCET.

SIR,—You will excuse my trespassing upon your time and space, but on reading Mr. E. H. Worth's letter in your issue of July 4th I notice that he has misquoted the principal resolution passed at the general meeting on June 27th. As chairman on that occasion I feel it my duty to give the resolution in full as passed with only four dissentients. It is as follows:—

> Resolved: That refusal of service in any capacity under the National Insurance Acts, 1911 and 1913 be a condition of membership of the National Medical Union. Nothing in this resolution shall prevent any member of the National Medical Union from signing certificates to enable insured persons to obtain sanatorium and sickness benefits under the National Insurance Acts in his private professional capacity.

May I congratulate Mr. Worth on his generous offer to the guarantee fund? He is not alone in his enthusiasm, and I can assure him that the National Medical Union stands to become a power in the land.

Hoping that many non-panel readers of your valuable paper will respond to his very forcible appeal for their support to the National Medical Union,

I am, Sir, yours faithfully,
VIVIAN T. GREENYER.

"Edzell," New Church-road, Hove, July 6th, 1914.

To the Editor of THE LANCET.

SIR,—I read with much pleasure Mr. Worth's letter in your issue of July 4th, and I desire to add my appeal to his and urge all non-panel men to join the National Medical Union, and thereby assist to uphold the best traditions of the profession. The fight, deplorable though the sequel has been, is by *no means* over, and there may yet be critical times ahead. Surely, then, it is the duty of every man who from principle has not joined a panel to take some part in the work of the National Medical Union, and surely, also, support may reasonably be expected from the consultant branches of the profession, and especially from those who, as teachers in the medical schools, can influence future practitioners.

I shall be glad to join Mr. Worth in increasing my guarantee to a similar extent, and I have no doubt many others will do the same. There are 15,000 non-panel men in the country, and it should be easily possible to make the National Medical Union a most powerful association.

I am, Sir, yours faithfully,

Huddersfield, July 7th, 1914. W. L. W. MARSHALL.

THE NORWICH MEDICAL INSTITUTE.

To the Editor of THE LANCET.

SIR,—I have read with considerable pleasure the remarks of your Commissioner in THE LANCET of July 4th (p. 51), on the work of the Norwich Medical Institute, of which I am one of the medical officers. I am sorry not to have had an opportunity of meeting your Commissioner during his visit to Norwich, when I think I could have shown even more conclusively that institutional practice gives opportunities for good work to be carried on.

I have only one criticism to offer of your otherwise fair summary, and it is on the question of sweating. I do not know what dictionary your Commissioner uses, but mine defines sweating as "the practice of employing poor people at starvation wages." I must therefore beg to differ from him as to the strict meaning of the word "sweating." But apart from this verbal quibble your Commissioner—quite unintentionally I willingly believe—proceeds to convey the impression that this institute, like some others, makes a profit for other purposes out of moneys paid for medical services. Such is not the case, and has never been the case for many years before the coming of the Insurance Act—certainly not within the seven years of my association with the institute. With the exception of a small balance carried over from year to year the whole of the income has been absorbed by the medical needs of the members, with the single exception of an insignificant sum—quoting from memory I think about £12 per annum—paid to the Medical Alliance (a body formed to guard the interests of institutes generally) in subscriptions and expenses of delegates to an annual conference extending over two days. For years the lay members of the board of delegates and management committee have not received a farthing for their services. They are now, since the Insurance Act came, paid a small fee for each attendance, which payment has been sanctioned by the Insurance Commissioners as reasonable.

There have been two other payments to which the local division of the British Medical Association has taken exception, though they are both in a sense medical payments. One is a subscription of 5 guineas annually to a convalescent home, and the other is the payment of consultation fees when recommended by us, the medical officers, in cases requiring special advice which could not be obtained at the hospital, and for which the particular patients were too poor to pay. But though the British Medical Association has denounced these payments certain medical men, who would not meet us in consultation, have not been above taking these fees, though well knowing that the institute paid them. I should add that these consultation fees have not averaged more than 12 guineas a year for several years.

I quite fail to see how these payments can be called making a profit out of our service. Why, Sir, so far from wishing to "sweat" us in this way our committee has, owing to delay in payment by the Local Insurance Committee, borrowed money last year rather than ask us to accept a penny less than the percentage to which we were entitled by our agreement with them. They might with fairness have asked us to share the risk and the delay, but they took the whole burden themselves. I speak of lay management as I find it.

I am, Sir, yours faithfully,

Norwich, July 4th, 1914. ARTHUR H. PRIESTLEY.

VITAMINES AND AN UNUSUAL CASE OF SCURVY.

To the Editor of THE LANCET.

SIR,—As your readers at the present time seem to be interested in vitamines, perhaps the following case of "scurvy" may be of interest.

Mr. X., aged 23, came to the Malay Peninsula to plant rubber. He had eaten nothing but porridge, bread (white) and butter, and milk since the age of 3 years. He had always been very fit and well, was of good physique, and had had some success at football, cricket, &c. Four months after arrival in the Federated Malay States subtertian malaria set in, and six months after arrival he went into the European hospital of the State, complaining of swelling of the left leg and a large "bruise." There was no history of injury and he was discharged in 11 days. A fortnight after his discharge from hospital a second attack of malaria was experienced. Ten months after his arrival in this country he had a third attack of malaria. Then one month after this he returned to the European hospital, as his right leg went "black" and was swollen and painful. There was no history of injury. A diagnosis of scurvy was made. As the patient had nausea at the sight of soup, meat, &c., and vomited if he tried to eat them, he drank lime squashes. He then came under my care, with a view to his being sent home. The patient was bronzed, but had lost 1½ st. in weight lately. The right leg was still swollen and discoloured about the ankle. Pressure on the tibia was very painful. The heart, chest, &c., were clear. Hæmoglobin, 70 per cent. (Tallquist). No parasites in blood. Red blood corpuscles, 3,800,000; white blood corpuscles, 25,000. Urine and fæces, normal.

The patient lived with me for over a week, and as I had no porridge prepared he had to eat "at" whatever was going, and soon could take soup, potatoes, rice pudding, and very little green vegetables and a banana. He quickly improved and was sent to another estate, where there is a resident doctor. He did light work, but soon made porridge his chief article of diet again. In a month he had his fourth attack of subtertian malaria and returned to my care. Hæmoglobin, 65 per cent.; red blood corpuscles, 3,200,000; white blood corpuscles, 25,000. Having scratched a mosquito bite his right leg quickly swelled up and became septic, and when this had healed he returned to England.

This case has two or three points of interest. 1. A man living on practically nothing but porridge without any apparent cause. 2. Scurvy amongst Europeans is extremely rare in the Federated Malay States. I can hear of no other case. 3. The fact that he kept fairly fit so long. I take it that he would probably never have got "scurvy" if he had been able to obtain fresh milk. Fresh milk is very hard to obtain here, and when one has once seen a cow milked one feels much happier with the tinned variety. Also, brown bread is difficult to obtain and does not seem to be made to any extent by the native bakers.—I am, Sir, yours faithfully,

Kuala Lumpur, F.M.S. R. McC. LINNELL.

THE COUNCIL ELECTION AT THE ROYAL COLLEGE OF SURGEONS OF ENGLAND.

To the Editor of THE LANCET.

SIR,—May I through the medium of your columns thank those gentlemen who voted for me in the recent election to the College Council? At the same time, I would like to take this opportunity to make it distinctly understood that I dissociate myself entirely from the very undiplomatic letter to which Mr. Percy Dunn takes exception in your issue of July 4th. His complaint as to its tone is very justifiable, and its terms are calculated to alienate the cause of the Members and to put back the realisation of their claims.

When I seek election next year I shall reply to the questions sent me with this experience well in memory. I am, Sir, yours faithfully,

MACLEOD YEARSLEY.

Queen Anne-street, W., July 7th, 1914.

THE BACTERIOLOGICAL EXAMINATION OF MILK.

To the Editor of THE LANCET.

SIR,—I am glad that a distinguished bacteriologist in the person of Professor R. T. Hewlett has come forward to point out in your issue of July 4th (p. 44) the fallacies inherent in the quantitative enumeration of bacteria in milk.

At the Infants Hospital, Vincent-square, S.W., the milk coming from the hospital farm and from other sources is examined daily, and I have long been of the opinion that the bacterial count method is of little value. Especially is this so when *milks* are examined in *different* laboratories and the results are compared. The difference in the precise method and in the media employed (even the slight differences in the preparation by competent persons of the same medium), and many other factors, result in all kinds of serious error. Of the greatest importance is the fact that the milk with the higher count may be a much better milk than that with the lower. Thus, we find that A contains 55,000 bacteria per c.c., while B only contains 14,000. But when we come to our observations in regard to (1) time of curdling at 19° C. and 38° C.; (2) development of acidity at 38° C., (3) character of curd formation—gas production or otherwise, (4) nature of bacteria developing in the milk at 19° C. and 38° C., we find that A is a much better milk than B, for the changes in A compare more closely with the changes occurring in a milk taken directly from the cow under strict precautions than do those in B. One method is of great value —the microscopical examination of the centrifugalised deposit suitably stained. By this method an experienced observer can obtain information of the greatest practical importance. Not only can the number of bacteria be approximately estimated, but important information can be obtained with regard to the nature and probable source of any contamination. Thus, Gram-negative bacilli generally indicate colon organisms and consequently manurial contamination. Dust from dirty fodder can be recognised both by the general débris and by the presence of moulds. The cellular elements in the milk are readily recognised and early warning of mastitis may be forthcoming. An interesting point is *that in the case* of a contaminated milk the observer is *often able* to make a prognosis in regard to the behaviour of the milk when submitted to the above-mentioned tests. If this prognosis proves to be correct the case against the milk is a strong one. The great practical value of the method is its rapidity. Within half an hour of the receipt of the milk the examination of the centrifugalised deposit can be completed, and consequently, in the case of any defect in quality, we are able immediately to telephone to the farm, at the same time indicating the probable source of the contamination. It is *important that the centrifuge should be of large capacity*, so that the samples of milk may be sufficiently *ample to be representative*, and we have recently *installed* Professor S. Delépine's centrifuge as with this instrument over 1½ litres can be dealt with at one time, while owing to its high speed (at 5000 revolutions—over four miles a minute) the usual time of centrifugalisation is much shortened. I am, Sir, yours faithfully,

Harley-street, W., July 4th, 1914. RALPH VINCENT.

TOUCHING FOR THE KING'S EVIL.

To the Editor of THE LANCET.

SIR,—A second letter upon this subject from Dr. F. Parkes Weber having appeared in your columns on June 27th, may I be excused for taking up my pen at his request in the hope of partially replying to some of the questions put forth by him?

He asks firstly: "Are the old well-cast specimens [of that much-discussed token, *Medallic Illustrations*, Plate xxxiii., 23] to be regarded *all of them* as forgeries of the period for the use of ill-disposed persons to gain fraudulent access to the king?" To this I reply that the wording of the document mentioned by me in my last letter, and which will be published in full in the *British Numismatic Journal*, lies open to a dual interpretation. The passage reads: "Whereas wee are informed by our Serjeant-Chirurgion, that there hath been a great abuse comitted by dissolute and ill-disposed People, who to gaine the Gold only, have counterfeited his tokens, which were cast in a mold made by a Freemason, wherein we have not only been deceaved of many Angells," &c. The grammar, if correct—a doubtful assumption at that period—should mean that the original tokens were cast by the Freemason. Against this is the fact that both struck and cast pieces of the better class exist, but it was no uncommon practice, as we notice in the case of badges and medals of Stuart times, to make one pair of dies, and after striking from them a number of specimens, to multiply these by casting. We might also read the passage as meaning that the Freemason was the forger, but this is immaterial, for fraudulent casts had clearly been made, and some poor examples seem to fit into this category.

Dr. Parkes Weber's second question relates to the fact that we have seen no tokens the size of an angel, and suggests that this condition may have been abandoned. But this I venture to think was unlikely as the change of size would be material in distinguishing the new token from the old, no mention being made of an alteration in design. We might account for the above rarity by the injunction that the tally should be returned to the mintmaster after use, "whereby he may know what number of Angells have bin expended." Naturally under the Commonwealth, "touching" being no longer in vogue, the officials would melt down the metal lying idle. Some pieces, however, should have escaped, being unredeemed, and unless such be found this point must remain "non proven." I am far from suggesting that the other pieces referred to by Dr. Parkes Weber were not made for a similar purpose of admission, but might they not be intended for the coronation or some other ceremony, inasmuch as the legends are less appropriate to "healing" than that of the token which we have discussed?

I did, however, in my lecture in May before the British Numismatic Society go so far as to *mention* the possibility that the "Soli Deo Gloria" pattern halfpenny—for as such its exact weight induced Mr. Montagu to class it (see Montagu's "Copper Coins of England," p. 41, No. 1)—*of* the second Charles, might be a ticket of admission to his "touching" séances. It is not very rare and exists in various combinations of metals, a not unlikely precaution to regulate the number of persons coming in successive weeks, for the "healings" under this king were very frequent. Mr. McLachlan suggested that it might be the touchpiece of Charles II.'s exile, and put forth in the *Numismatist* for March, 1912, excellent arguments for this attribution, which we have no documentary evidence to disprove.

Lastly, Dr. Parkes Weber refers to the silver touchpiece in the Wellcome Historical Medical Museum, reading IAC. 8 instead of IAC. 3. This is an example highly interesting to the student, not only from its rarity, but for historical associations, agreeing as it does in other respects with the type used by James Francis Edward during his exile in France, whilst this Scottish title brings to mind the dies, bearing date 1716, engraved for the *King de Jure*, as Jacobus VIII., and intended for the coinage of the northern kingdom, had his second invasion proved successful.

I am, Sir, yours faithfully,
HELEN FARQUHAR.

Belgrave-square, S.W., June 30th, 1914.

To the Editor of THE LANCET.

SIR,—I regret a misstatement in my brief note on the above subject in your last issue. The coin alluded to is *not* the one that caught my attention in the Hodgkin collection: my informant and I misapprehended one another.

I am, Sir, yours faithfully,

London, July 6th, 1914. RAYMOND CRAWFURD.

LATIN FOR MEDICAL STUDENTS.

To the Editor of THE LANCET.

SIR,—I was interested in your annotation on Latin for medical students in THE LANCET of June 27th. I heartily endorse your remark that "the student who has learned Latin will find his examinational career much easier." The fact is, that unless the teaching of classics be so reformed as not to clash with conditions which have vastly altered in the last 25 years, it will have to go. The modern boy can have his interest in Latin awakened if after the necessary grammatical preliminaries he is assisted to read intelligently the more interesting authors. He ought to read far more and do less of putting English into Latin. The master should assist him in class to translate unprepared passages, while he explains all the historical and antiquarian matter necessary to render the author intelligible. Such mysteries as the ethic dative, anacoluthon, and oxymoron are best avoided. The practice of prescribing a set book for an elementary examination is an abomination which London University has done its best to end. Boys who are instructed in class how to tackle passages they have never seen before are bound to get a better grip of Latin than those who work up a set book and notes parrot fashion. Unless the Universities of Oxford and Cambridge can be got to abolish compulsory Greek for those destined for mathematical, medical, or scientific careers the whole fabric of the classics as a valuable educational medium will be crushed under the juggernaut car of modern hustle. Latin verse composition for the average boy is a hideous waste of time, while Greek iambics are something worse. I well remember as a young boy being dragged through Book II. of the Gallic War with never a glance at the map or a word on field service conditions in the Roman army. The same absence of intelligent teaching doutless lies behind the well-known schoolboy regret that the falling tree did not after all make a slightly better shot for Horace's skull—

> . . . prope funeratus
> Arboris ictu.

I am, Sir, yours faithfully,

Shadwell, E., June 30th, 1914. ATHOLE ROSS.

THE NATIONAL INSURANCE ACT.

THE REPORT OF THE NATIONAL INSURANCE COMMISSION.

THE report of the Insurance Commissioners dealing with the second year of the working of the National Insurance Act gives the following figures with regard to the number of medical men on the panels. 1913: Jan. 15th, 13,996; April 14th, 15,659; Oct. 13th, 15,870. 1914: May 31st, 16,059. The Approved Societies are stated to have 10,533,220 members, the Friendly Societies accounting for 4,856,584. Of this total industrial insurance companies account for 3,759,396, and trades unions for 1,154,484. The other organisations concerned are collecting societies with 663,659, and employers' provident funds with 99,097 insured persons on their lists.

The portion of the report devoted to estimating the financial position of the Approved Societies will naturally be of considerable interest to those concerned with the practical working of the Act, and particularly to the medical profession, because there has been a tendency among Friendly Societies, whether conscious of financial danger or not, to complain that any excessive expenditure upon sickness benefit has been exclusively caused by laxity on the part of the medical profession. The report of the Commission affords little or no proof that this ascription of blame is correct, so far as any serious responsibility for the financial position of the societies is concerned, although Mr. A. W. Watson (the chief actuary of the Commission) is of opinion that an excess of sickness claims referred to below points to the necessity for increased vigilance on the part of societies and of medical men giving certificates, and further expresses the opinion that it is impossible to doubt that there has been in many quarters too little recognition of the high degree of confidence which Parliament reposed in the medical profession when it decided to withdraw the administration of medical benefit from the Approved Societies, and that a great improvement in certification is both necessary and practicable. The general conclusions which he arrives at with regard to the Approved Societies and the incidence of sickness benefit are summarised as follows:—

1. The sickness claims of men, taken as a whole, have been within the actuarial provision.
2. The sickness claims of women, taken as a whole, have been materially in excess of the actuarial provision.
3. Great variations have arisen between the sickness claims made upon individual societies. While in many cases the claims have exceeded the estimates, there are many other cases in which the cost of the benefits has been so far within the estimates as to lead to the expectation that a large number of societies and branches will be found upon the first valuation to be in possession of surpluses.
4. The sickness claims of both men and women have been, in the case of many societies, above the standard which should normally prevail, and which may be expected to obtain when societies have become experienced in administration.
5. The claims for maternity benefit have varied considerably as between different societies.

It may be pointed out that any conduct of medical men producing an unjustifiable drain upon the resources of Friendly Societies might be expected to affect them generally, rather than to produce variations between the claims made upon individual societies. Also it is evident that financial strain upon the funds of societies is most markedly felt in the case of claims made by women. The existence can hardly be urged seriously of a negligent tendency by medical men on the panel to favour the claims of women to sickness benefit. Mr. Watson refers in particular to the allowance of benefit to pregnant women, and observes that many of those claims have been on the border line of justification, and that nearly all represent demands unknown to the societies which were made before the Act provided for women, and would have been repudiated by them as not within the scope of insurance against sickness.

THE LONDON INSURANCE COMMITTEE AND THE DISTRIBUTION OF THE UNALLOTTED FUNDS.

The London Insurance Committee having been advised by their medical benefit subcommittee either to proceed at once with the distribution of the fund in their hands in respect of unallotted patients, or to express the opinion that the Insurance Commissioners should undertake to distribute it, were asked at a meeting held on June 25th, by Mr. F. Coysh, chairman of the general purposes subcommittee, to distribute the fund immediately. Mr. Coysh's motion to that effect was however displaced by an amendment moved by Mr. Kingsley Wood and eventually carried after discussion, in the course of which medical members of the committee protested strongly against the further delay which would be involved and against departure from the principle of distributing in proportion to the numbers on the lists of the recipients. The amendment thus adopted was "that having regard to the decision of the committee that it is undesirable that any medical man on the London panel should undertake to treat a larger number of insured persons than 2000, the committee is not prepared to distribute the surplus moneys in the panel fund on a *pro ratâ* basis unless and until a legal decision has been obtained or further parliamentary authority has been given."

THE LONDON COUNTY COUNCIL AND THE LONDON INSURANCE COMMITTEE.

The London County Council is entitled to appoint 19 out of the 80 members of the London Insurance Committee and three of its nominees must be medical practitioners. The Council has selected the following as its medical representatives for the year 1914–15: Sir John Collie, Sir Shirley F. Murphy, and Dr. R. M. Beaton.

THE LOCAL GOVERNMENT BOARD AND THE TUBERCULOSIS SCHEME FOR LONDON.

The London County Council has received a letter from the Local Government Board commenting on the scheme for the residential treatment of tuberculosis approved by the Council on May 26th (THE LANCET, May 30th, p. 1559). The Board stated that, in consequence of the refusal of the London County Council to bear any part of the cost of treating insured persons, it understood that the London Insurance Committee did not propose to arrange for residential accommodation through the County Council. There were clearly many advantages in dealing with insured and uninsured persons by one scheme, and the Board greatly regretted that the County Council had not been prepared, as the councils of other great towns had been, to undertake to provide the accommodation necessary for the whole community, subject to the condition that half the annual cost, after deducting receipts from the Insurance Committee and other sources, would be met out of grants from the Local Government Board. The Board had some doubt whether the proposals of the Council in regard to the selection of cases for residential treatment would prove satisfactory in actual working. While the Board took no exception to the establishment of the proposed honorary advisory board, it considered that the Council, instead of authorising this board to appoint medical referees to examine selected cases for residential treatment, would have been well advised to appoint a clinical tuberculosis officer, whose duties would have included advising the Council in the selection of cases for residential treatment. The proposed system of payment by fee per case the Board did not regard desirable as part of a permanent arrangement. Presumably the number of cases normally referred to the medical referees would only be a small proportion of the whole; otherwise the expenditure for this purpose would be unduly high. The Board, however, would not object to these proposals on the understanding that they were reviewed at the end of 12 months, when, if experience showed them not to be satisfactory or economical, some other machinery for selecting cases could be adopted. It was important that no action should be taken which might debar persons in need of treatment from obtaining it, and if any charge was made it should only be in cases in which there was clear evidence that a contribution towards the cost might be expected. It did not appear to the Board that any obligation could be imposed on medical practitioners who recommended cases for residential treatment to investigate and advise as to the financial circumstances of the patients. Subject to these comments the Board approved generally of the proposals of the Council as regards adults, on the understanding that the provision of beds at present proposed was to be regarded as an instalment only.

The Board is in communication with the Board of Education in regard to the proposals for the treatment of children. It will be necessary for the institutions in which beds are retained by the Council to be approved by the Board for the treatment of tuberculosis if such approval has not already been given.

The National Medical Union.

The first general meeting of this Union was held in London on June 27th, when the report of the provisional council elected at the conference in November last was dealt with and the permanent officers were appointed. It was decided that the Union should apply for registration under the Companies Act, 1867, without the word "limited" as part of the title, and that the liability of members should be limited by guarantee to £1. Arrangements were made for the immediate election of the permanent council by the federated associations on the basis of one representative for every association of 25 subscribers and under, with an additional member for every 20 additional subscribers, the minimum membership entitling any society to elect a member of council being fixed at 10. The following, among other resolutions, were adopted as the basis of the policy of the Union:—

1. To organise the medical profession to the highest possible degree of efficiency in defence of its freedom and in protection of its economic interests.
2. To render every service possible to non-panel practitioners.
3. To oppose any prospective legislation to include dependants of insured persons participating in the medical benefit of the Acts under the present arrangements.
4. To agitate for repeal of the medical benefit sections of the Insurance Act, or such drastic amendments as would bring these sections into harmony with the principles of freedom on the part of the profession and public.
5. To lay down the principle of unrestricted free choice of doctor in any form of national insurance, to insist upon the unrestricted right of insured persons to make individually their own arrangements in connexion with the Insurance Act, and to insist that no doctor attending such persons be required to sign any contract with the Commissioners or any committee under the Act.
6. To place before the public in any and every way possible the dangers of the Act to public health, and its injustice to doctor and patient alike.
7. To maintain that a Medical Service is necessary for the genuinely necessitous classes of the community, *and for them only.*
8. To preserve an independent attitude with regard to party politics.

Further, it was agreed that the National Medical Union is not opposed to the principle of Health Insurance under such conditions as would conform with the other principles of its policy.

Charges for Medicine Supplied by Medical Men.

The Darwen Insurance Committee passed a resolution recently commending the Lancashire Insurance Committee for "proceeding against panel doctors for charging insured persons for medicine." From the discussion on the subject it appeared that the case for the medical men was that insured patients sometimes prefer to pay for medicines made up by their medical attendants to taking a prescription to a druggist who would supply the medicine free of charge. On the other hand, it was stated that the insured person was often not aware that he could take a prescription and get it made up without having to pay for it, and that in some instances patients were being told that the medicine supplied by the druggist would not be the same as that of the medical man. The question what course the medical man should take when asked to supply medicine by a patient who preferred to have it from him was propounded by a medical member of the committee. It seems reasonable that an insured person should have the same freedom in such a case as one uninsured. Naturally any representation of a misleading character ought to be dealt with by an insurance committee with severity adapted to the needs of the individual case.

Mr. Arthur Hopewell-Smith, M.R.C.S. Eng., L.R.C.P. Lond., John Tomes prizeman of the Royal College of Surgeons of England and surgeon and lecturer on dental anatomy and physiology at the Royal Dental Hospital of London, has accepted the professorship of comparative odontology and dental histology, which the University of Pennsylvania at Philadelphia has decided to establish and endow.

Medical News.

UNIVERSITY OF CAMBRIDGE.—At the examinations for medical and surgical degrees, held recently, the following were successful:—

FIRST EXAMINATION.

Part I., Chemistry, and Part II., Physics.—E. Goodwin, Emmanuel.
Part III., Elementary Biology.—E. Goodwin, Emmanuel; and S. Riddiough, King's.

SECOND EXAMINATION.

Part I.—A. M. Ahmad, Downing; D. J. Batterham, Caius; D. C. Beaumont and W. H. Blackburn, Christ's; T. A. Butcher, Queens'; P. D. Chapman, Sidney Sussex; R. S. Corbett, Caius; G. P. Crampton, Downing; J. M. Downie, Christ's; A. Drewe, Trinity; J. R. Earp, St. John's; H. W. Eddison, Christ's; R. W. Fawcett, Caius; L. P. L. Firman-Edwards, Trinity; G. A. Fisher, Jesus; R. French, Downing; E. O. Goldsmith, Pembroke; G. A. Goolden, Caius; W. S. Gross, Jesus; E. A. H. Grylls and J. S. La Fontaine, Caius; J. H. Le Brasseur, Pembroke; G. Lyon-Smith, Emmanuel; W. J. MacCombie, H. H. Marten, and C. K. Mowll, Caius; D. M. Muir, Trinity; C. L. Odam, Sidney Sussex; A. Orr-Ewing, Pembroke; R. R. Powell, Emmanuel; I. M. Rattray, D. W. R. Richardson, E. N. Showell Rogers, O. S. Thompson, and G. H. Ward, Caius; C. R. H. Weekes, Trinity; and A. Winfield, Downing.
Part II., Pharmacology and General Pathology.—J. O. Andrews, St. John's; G. L. Attwater, Pembroke; S. L. Bhatia, Peterhouse; A. L. Bodley, Clare; G. A. G. Bonser, St. John's; E. D. Broster, Christ's; M. Chadwick, St. John's; G. D. Compston, Trinity Hall; E. V. de Souza, Downing; A. W. R. Don and E. Donaldson, Trinity; J. R. Harris, Queens'; A. G. Irving, King's; L W. Jones, Emmanuel; J. B. Leather and F. G. Lescher, Caius; W. H. Marshall, Pembroke; C. G. T. Mosse, Caius; D. F. A. Neilson, Trinity; J. H. Parry, St. John's; C. F. Pedley, Jesus; F. S. L. Piggott, Emmanuel; J. S. Pooley, Trinity; R. A. W. Procter, Clare; W Raffle, St. John's; C. M. Ryley, Emmanuel; T. S. H. Schäfer, Caius; W. G. A. Schüddekopf, Emmanuel; C. G. Schurr, Caius; H. W. Scott, Clare; B. H. Swift and E. P. W. Wedd, Caius; H. A. Whyte-Venables, Queens'; S. M. Wilcox, Emmanuel; and A. T. Woolward, Caius.

THIRD EXAMINATION.

Part I., Surgery and Midwifery.—S. G. Askey, St. John's; *W. F. Bensted-Smith and E. C. Bradford, Pembroke; F. L. Cassidi, Corpus Christi; G. M. Cowper and K. B. Dickson, Trinity; C. L. Gimblett and C. H. M. Gimlette, Caius; H. Hartridge, King's; J. B. Hunter, St. John's; *C. C. Kerby, Trinity; F. G. Lescher, Caius; *Q. Madge, Emmanuel; R. W. Meller, Trinity; R. K. Merson, Emmanuel; A. B. Pavey-Smith, Clare; *J. W. Pigeon, Christ's; W. B. Purchase, Sidney Sussex; *E. C. Rayner, Caius; G. D. Read, St. John's; J. R. Rees, King's; J. E. Sharp, Caius; A. G. Shera, Emmanuel; *H. A. Smith, H. Selwyn; *R. Stansfeld, St. John's; C. R. A. Thacker, Downing; *J. R. A. Todhunter, Caius; and H. G. Wiltshire, Emmanuel.

* In Surgery only, having previously been approved in Midwifery and Diseases of Women.

Part II.—S. G. Askey, St. John's; D. C. G. Ballingall, Emmanuel; H. A. Bell, Jesus; W. G. Bigger and P. R. Boswell, Queens'; E. C. Bradford, Pembroke; H. P. Dawson, Trinity; E. L. Dobson, King's; A. T. Edwards, St. John's; W. B. Gordon, Clare; H. Hartridge, King's; F. G. Lescher, Caius; R. W. Meller, Trinity; A. B. Pavey-Smith, Clare; D. V. Pickering, Emmanuel; S. G. Platts, Caius; L. C. Rivett, L. E. S. Sharp, and A. C. S. Smith, Trinity; P. Stocks, King's; and C. R. A. Thacker, Downing.

UNIVERSITY OF LIVERPOOL.—The degree of M.D. has been conferred upon the following:—

J. Bamforth, H. M. Berry, W. E. Cooke, I. C. Edwards, H. W. Jones, R. Kennon, H. Nield, H. Pierce, and G. F. R. Smith.

At examinations held recently the following candidates were successful:—

DEGREES OF M.B. AND CH.B.

Final Examination.—Part I.: H. Garas, A. G. M'Coll, H. C. Roberts, and J. Rumjahn. Part II.: Ruth I. Bateman, R. L. Blenkhorn, C. P. Brentnall, G. S. Graham, J. P. Johnson, R. J. Minnitt, L. Oldershaw, and C. G. Skinner. Part III.: G. D. Harding, R. Martlew, A. G. N. Misbah, R. Rimmer, R. E. Roberts, L. B Stott, A. W. Weston, and J. St. G. Wilson.
Honours.—First Class: Ethel Chadwick. Second Class: G. H. Darlington and G. H. Pearson.
Second Examination.—Part A: A. L. Davies, D. C. Grundy, and Edna E. Mawson. Part B: N. J. Allan, M. Azer, A. G. Brett, A. J. B. Griffin, Amy Hodgson, R. Nixon, S. Pool, A. M'K. Reid, and E. S. Stubbs.

VICTORIA UNIVERSITY OF MANCHESTER.—At examinations held recently the following candidates were successful:—

FINAL M.B. AND CH.B. EXAMINATION.

*Lily Allan, Basil Browning, Frank Chadwick, J. W. Craw, H. C. Duffy, C. W. Fort, *†D. T. Harris, J. R. Jagger, *O. M. de Jong, E. A. Linell, Kate K. May, A. S. Paterson, ‡J. R. B. Russell, J. E. Slack, and E. H. Walker.
Obstetrics.—G. B. Horrocks, Kamil Maximus, and H. A. Sandiford.
Medicine.—W. S. Booth, G. B. Horrocks, and Kamil Maximus.
Surgery.—G. B. Horrocks.
Forensic Medicine and Toxicology.—J. C. Bramwell, A. T. Gibb (distinction), Edgar Granger, William Halliwell, J. G. McKinlay (distinction), H. M. von Mengershausen, J. F. C. O'Meara, F. G. Prestwich, John Rigby, C. G. Todd, Frank Vause, Louis Walton, and Richard Willan.

* Second class honours. † Distinction in Obstetrics.
‡ Distinction in Surgery.

THIRD M.B. AND CH.B. EXAMINATION.

Pharmacology and Therapeutics and Hygiene.—G. S. Bate, H. W. Bennett, Hitchon Chadwick, William Christopher, Richard Colley, Eva L. Glasier, Alice M. A. Holt, R. L. Newell, F. C. Ormerod, J. A. Panton, Nesta H. Perry, Dorothy Potts, C. R. Sandiford, and Walter Stansfield.
Pharmacology and Therapeutics.—J. H. Albinson.
Hygiene.—J. D. Byrd.

FIRST M.B. AND CH.B. EXAMINATION.

Part III. (Organic Chemistry and Biochemistry).—Nooman Abloh, T. H. Almond, May Ashburner, Sybil Bailey, Mary G. Cardwell, H. J. Chronnell, Thomas Colley, S. E. Critchley, Elizabeth C. Davies, Herbert Dickie, E. B. A. Edleston, Percival Fildes, G. H. W. Gough, F. L. Heap, F. S. Horrocks, Fahim Isaac, A. W. Kirkham, J. H. Lees, John Mills, Terence O'Brien, Kathleen O'Donnell, Ellis Pigott, H. J. Porter, A. R. Redfern, Lazarus Samuels, A. G. Saunders, L. J. Schwartz, V. T. Smith, J. T. Walker, Marie Wardman, and Ethel D. Willis.

FINAL B.D.S. EXAMINATION.

H. H. Stones (First-class honours), and M. C. Paterson (Second-class honours).

DIPLOMA IN DENTISTRY. (FINAL EXAMINATION.)

E. D. Batty, Benjamin Brown, E. W. Fish, F. P. H. E. Kolligs, Frank Lyth, G. N. Scotts, R. S. Smith, and Aquila Whitehead.
Pathology.—T. B. Place.
Systematic Surgery.—John Smith and J. V. Wilkinson.
Dental Prosthetics and Operative Dentistry.—T. B. Place and John Smith.
Dental Surgery.—J. V. Wilkinson.

UNIVERSITY OF DURHAM: FACULTY OF MEDICINE.—At examinations held recently the following candidates were successful:—

FIRST EXAMINATION FOR THE DEGREE OF BACHELOR OF MEDICINE.

Elementary Anatomy and Biology, Chemistry and Physics.—First Class Honours: William Edward Mandall Wardill, College of Medicine, Newcastle-upon-Tyne. Pass List: Montague William Augustus Sandoe, Guy's Hospital; and Habib Toma, College of Medicine, Newcastle-upon-Tyne.
Chemistry and Physics.—John Neville Alexander, Alan Angus, Douglas George Patrick Bell, Edgar Frederick Herbert Bell, John Arthur Gardner Brewis, and Ernest Dewar Charles, College of Medicine, Newcastle-upon-Tyne; Harold Charles Clifford-Smith, Charing Cross Hospital; Wallace Alexander Freedman, Giles Arthur Michael Hall, Alexander Thomas Harrison, and Mary Kathleen Henegan, College of Medicine, Newcastle-upon-Tyne; Reginald Arthur Hickley, St. Mary's Hospital; and George Eric Hyden, William Arthur Jaques, Robert Turnbull Euston Naismith, Charles Burton Phillips, Gainsford Reed, Frank Wesley Sopwith, and Louis William Studdy, College of Medicine, Newcastle-upon-Tyne.
Elementary Anatomy and Biology.—Ewart Gordon Anderson, London Hospital, and College of Medicine, Newcastle-upon-Tyne; and Ibrahim Girgis, Samuel Elijah Goulstine, Hamed Kamel, Robert Graham Melrose, George Galloway Robertson, Thomas Wilfrid Robertson, George Howard Shanley, and Arthur Wilfred Wilkinson, College of Medicine, Newcastle-upon-Tyne.

UNIVERSITY OF DUBLIN.—The following degrees have been conferred:—

M.D.—H. R. M. Ferguson, E. S. Johnson, C. O'Brien, R. O. Smyth, R. E. Tottenham, and H. L. W. Woodroffe.
M.B., B.Ch., B.A.O.—T. W. Allen, J. N. Armstrong, C. D. M. Buckley, J. G. Butt, J. C. A. Dowse, J. S. English, H. R. Ford, N. H. H. Haskins, Rev. E. E. Lacy, T. A. Lawder, H. C. D. Miller, J. D. Oliver, T. D. Power, F. A. Roddy, W. A. Ryan, W. O. Tobias, W. R. L. Waters, and G. H. Wood.

The following licences have been granted:—

L.M., L.Ch., L.A.O.—E. Evans and J. H. Fletcher.

BRISTOL GENERAL HOSPITAL.—The new wing which has been recently added to this hospital will be formally opened on July 27th by Mr. G. A. Wills, the president of the institution.

Alderman Edward Louis McSheehy, M.D., who was Mayor of Wimbledon for two years and is a justice of the peace for the county of Surrey, was presented on July 4th with the freedom of the borough of Wimbledon.

DONATIONS AND BEQUESTS.—The late Miss Ida Freund, of Cambridge, late staff lecturer in chemistry at Newnham College, has left among other large bequests £2000 to Addenbrooke's Hospital, Cambridge.—By the will of the late Mrs. Alice Eliza Davies, of Bury, widow of Dr. Clifford Davies, the testatrix left £500 each to the Robinson Kay branch of the Hospital for Incurables (Manchester), the Bury Infirmary Hospital, and the National Society for the Prevention of Cruelty to Children, Bury.—Mr. William Hough Hey, of Sherburn in Elmet, Yorks, has bequeathed by will £1000 to the Leeds Infirmary and £500 to the National Society for the Prevention of Cruelty to Animals.

ROYAL COLLEGE OF SURGEONS OF ENGLAND: ELECTION OF MEMBERS OF COUNCIL.—A meeting of Fellows was held on July 2nd to elect five members of Council. 1042 Fellows voted, 1028 of these by post and only six personally. Three of the votes were invalid; two because the signatures of the voters had not been witnessed, and one because the voter had voted for six of the candidates in place of five. Eight voting papers arrived after 3 o'clock, so that they could not be included in the voting. The result of the voting was as follows:—

	Votes.	Plumpers.
William Thorburn	534	53
Charles Alfred Ballance	434	5
William McAdam Eccles	351	23
James Stanley Newton Boyd	337	14
Charles Ryall...	304	13
John Bowring Lawford	256	5
Thomas Horrocks Openshaw	245	30
Walter George Spencer	238	2
Raymond Johnson	218	7
Frédéric Francois Burghard	204	4
Francis James Steward	177	25
Herbert Stringfellow Pendlebury	106	9
Thomas Herbert Kellock	99	0
Percival Macleod Yearsley	90	2

Mr. Ballance was declared re-elected, and Mr. Thorburn, Mr. Eccles, Mr. Boyd, and Mr. Ryall were declared elected members of the Council.

UNIVERSITY OF OXFORD: THEODORE WILLIAMS SCHOLARSHIPS.—The Theodore Williams Scholarship in Anatomy has been awarded to Kenneth F. D. Waters, scholar of Keble, and the Theodore Williams Scholarship in Pathology to Henry St. H. Vertue, B.A., University College; *proxime accessit*, Christopher J. A. Buckell, B.A., Corpus Christi College.

MR. THOMAS CHETWOOD, M.B. Lond., D.P.H. Oxford, has been appointed school medical officer and deputy medical officer of health for the city of Sheffield in the place of Dr. Ralph P. Williams, who recently resigned these posts to take up his duties as a senior assistant medical officer at the Board of Education. Mr. Chetwood was previously senior assistant school medical officer in Sheffield.

UNIVERSITY OF LONDON.—The Senate at its last meeting reappointed Sir Wilmot Herringham, M.D., Vice-Chancellor of the University for the year 1914–15. The following medical members of the Senate were appointed to the three statutory committees for the ensuing year. Academic Council: the Vice-Chancellor, Mr. H. L. Eason, Professor A. D. Waller, and Mr. H. J. Waring; Council for External Students: the Vice-Chancellor, Sir Thomas Barlow, Sir William Collins, Sir Thomas Crosby, Dr. E. G. Graham Little, Dr. Frederick Taylor, Mr. Waring, and Dr. S. Russell Wells; Board to Promote the Extension of University Teaching: the Vice-Chancellor, Sir Thomas Crosby, Dr. Graham Little, and Dr. Russell Wells. Sir Alfred Pearce Gould was elected chairman of the Graham legacy committee, and Dr. Frederick Taylor chairman of the committee of medical members of the Senate. Dr. R. H. Cole was re-appointed governor of Slough Secondary School.

DENTAL TEACHING AT LEEDS UNIVERSITY.—The dental department of Leeds University was established in 1905 to provide training for students in the modern applications of dental surgery, and to afford facilities for expert dental treatment to those financially unable to obtain it. The public of Leeds are indebted to the governing body of the dispensary for recognising the importance of this work and giving accommodation and other facilities for it in their buildings. Generous subscriptions of dentists and others made it possible to equip this dental department with up-to-date appliances. During the year 1912-13 3237 new patients were treated in the department, and over 14,000 operations were performed or completed; the number of students in attendance was 27. But the present accommodation will not long be adequate, and Leeds will probably soon have to establish a school of dentistry in its own buildings. The staff consists of 12 honorary dental surgeons, with a demonstrator, a house surgeon, a curator, a nurse, and a clerk. The honorary dental surgeons form a clinical dental committee, the chairman of the dispensary board being *ex officio* a member. The department has been self-supporting throughout, and has never become a charge on the dispensary. A scheme submitted by the dental surgeons and approved by the dispensary board has now been adopted by the council of the University, and will come into operation at the beginning of next session, under which the instruction in the dental department will pass under the control of the University and will have the status of University teaching. The honorary dental surgeons will become members of the staff of the University under the title of "clinical dental lecturers," and all future appointments to these lectureships will be made by the University council, and the dental committee will take its place among the academic bodies of the University.

Parliamentary Intelligence.

NOTES ON CURRENT TOPICS.

The Death of Mr. Chamberlain.

UNIVERSAL regret at the death of Mr. JOSEPH CHAMBERLAIN is felt at Westminster. For some years illness has withdrawn him from participation in the work of the House of Commons, and time has softened the feelings of asperity which are apt to be generated in keen political controversy. One aspect of his work at the Colonial Office may be specially mentioned here. That was the encouragement which he gave to the study of tropical diseases. He saw clearly that one of the great obstacles to the development of the possessions of the Crown in the tropics was the prevalence of diseases in them which played havoc with the health of the white man.

The Milk and Dairies Bill.

The main question which was discussed in regard to the Milk and Dairies Bill by the Standing Committee of the House of Commons on Thursday, July 2nd, was the inspection of persons employed in or about dairies. Clause 2 authorises the Local Government Board to make orders "for the inspection of dairies and persons employed in or about dairies." An amendment was moved to omit the workers from inspection, but it was opposed by Mr. HERBERT SAMUEL, President of the Local Government Board. He said that there was no intention to establish routine inspection into the health of the persons employed. What the Bill had in contemplation was the occurrence of an epidemic of diphtheria or enteric fever, and the necessity of taking steps to ascertain the cause. For example, certain people who had had enteric fever afterwards became carriers of the germs of the disease, and this danger had to be guarded against. The inspector on his rounds could see whether those who were coming into contact with the milk were cleanly in their persons. Several honourable Members strongly insisted that it was highly desirable to insist upon cleanliness amongst rural workers. The amendment was ultimately withdrawn.

On Monday, July 6th, the Committee had under consideration Mr. ASTOR'S amendment to insert a provision to authorise the use in connexion with the sale of milk of the term "certified milk" and to prohibit the application of such a description to milk which did not fulfil the prescribed conditions. Mr. HERBERT SAMUEL accepted the amendment. He said that much might be done to improve the quality of milk if a higher rate of profit could be obtained by traders who sold milk produced under a system of official regulation and inspection. Mr. ASTOR'S proposal was agreed to.

Milk and Dairies (Scotland) Bill.

The Standing Committee on Scottish Bills of the House of Commons has concluded its examination of the details of the Milk and Dairies (Scotland) Bill. The measure has been reported to the House. Some discussion on the powers of inspecting milk supplies arose during the last sitting of the Committee. Edinburgh and Glasgow under their private Acts possess wider powers of inspecting sources of supplies outside their areas than they would possess if they were under the provisions of the Bill. It was decided by the Committee that those two cities should retain their existing powers of inspection uncurtailed.

National Health Insurance Report.

The report for 1913-14 on the Administration of National Health Insurance has been published as a Parliamentary Blue-book.

Voluntary Insurance Bill.

Sir RICHARD COOPER has introduced in the House of Commons a Bill "to repeal the National Insurance Acts, 1911 and 1913, and to establish a system of voluntary insurance against loss of wages through sickness and unemployment, and for other purposes relating thereto." It was read a first time.

Housing Bill.

Mr. RUNCIMAN, President of the Board of Agriculture, on Wednesday, July 8th, introduced in the House of Commons a Bill for the purpose of giving to the Board of Agriculture and Fisheries "powers with respect to the housing in agricultural districts of persons belonging to the working classes, and to make provision with respect to the housing of persons employed by or on behalf of Government departments where sufficient dwelling accommodation is not available." The right honourable gentleman mentioned that it was proposed to provide £3,000,000 for rural housing and building cottages. The sum to be provided for housing Government employees amounted to £2,000,000. The Bill was read a first time.

HOUSE OF COMMONS.

WEDNESDAY, JULY 1ST.

Infant Mortality.

Mr. **PIKE PEASE** asked the President of the Local Government Board to state the rates of infant mortality and of stillbirths for the United Kingdom in 1913.—Mr. **HERBERT SAMUEL** replied: The rate of infant mortality in the United Kingdom in 1913 was 108 deaths under one year of age per 1000 births registered. The proportion of stillbirths cannot be stated, as these are not registrable, and information in regard to them is obtainable only for areas which have adopted the Notification of Births Act, 1907. These areas do not in all cases tabulate the information which they obtain, but it may be stated that during 1912 the stillbirths notified under this Act in the County of London numbered 2593. This number amounts to 2·4 per cent. of the total births notified, and to 0·57 per 1000 of the estimated population at the middle of the year.

THURSDAY, JULY 2ND.

Insured Persons in Ireland.

Mr. **WEDGWOOD BENN** informed Mr. **GRETTON** that the latest available figures showed that there were 729,598 insured persons in Ireland, of whom 717,798 were members of Approved Societies.

Deposit Contributors.

Mr. **RUPERT GWYNNE** asked the honourable Member for St. George's-in-the-East whether he would consider the advisability of making known at an early date the proposals of the Government regarding amendments to the National Insurance Act and the future position of deposit contributors in particular, so that honourable Members might have an opportunity of discussing these proposals with members of Approved Societies and others interested before the matter was discussed in the House.—Mr. **WEDGWOOD BENN** replied: The Insurance Commissioners are conferring to-day with the Advisory Committee, on which all types of Approved Societies are fully represented, and any proposals of the character referred to will be introduced without avoidable delay.

Grants to Pathological Laboratories.

Mr. **CHANCELLOR** asked the Chancellor of the Exchequer what amount of the sum of £250,000 to be applied this year to tuberculosis, nursing, and pathological laboratories was to be expended on pathological laboratories.—Mr. **LLOYD GEORGE** answered: The amount is £50,000.

Mr. **CHANCELLOR** asked the right honourable gentleman whether the work to be carried on in the pathological laboratories which were to be provided for in this year's Finance Bill would include experiments on living animals.—Mr. **LLOYD GEORGE** said in reply: The proposed grant is in respect of laboratories to be used primarily for purposes of diagnosis and not of research.

The Grant for Tuberculosis Treatment.

Replying to Mr. **ASTOR**, Mr. **LLOYD GEORGE** said: A statement will be made shortly giving particulars of the administration of the proposed grant for tuberculosis referred to in my speech on introducing the Budget.

Motor Ambulances and Petrol Duty.

Mr. **CROOKS** asked the Chancellor of the Exchequer what steps he was taking to exempt this year all authorities under the Local Government Board who had a service of motor ambulances to convey patients to hospitals and infirmaries from the duty upon petrol spirit.—Mr. **LLOYD GEORGE** wrote in reply: I am proposing to deal with this matter in connexion with the Revenue Bill, and if the honourable Member will put down a clause in due course I shall be glad to consider it.

MONDAY, JULY 6TH.

The Disabilities of Medical Officers of Health.

Sir **PHILIP MAGNUS** asked the President of the Local Government Board what steps, if any, he had been able to take to remove the pressing disabilities of medical officers of health as regarded insecurity of tenure, absence of any scheme of superannuation, and inability to obtain payment of travelling expenses in discharge of their duties, which were brought under his notice by the deputation which he and the Chancellor of the Exchequer and the President of the Board of Education recently received; and whether the position of sanitary inspectors, as regarded some of their disabilities, was likely to be improved.—Mr. **HERBERT LEWIS** (on behalf of Mr. **HERBERT SAMUEL**) replied: I can say no more at the present moment than that the matter is engaging the close attention of my right honourable friend.

The Grants for Sick Nursing.

Dr. **CHAPPLE** asked the Chancellor of the Exchequer whether he had received a communication from the Scottish National Conference of Friendly Societies urging that the administration of the grants for sick nursing, tuberculosis, and pathological laboratories be not separated from the present administrators of medical benefit; and, if so, would he say what his attitude would be towards their representations.—Mr. **LLOYD GEORGE** said in reply: The answer to the first part of the question is in the affirmative. I received a deputation on this subject on Friday last. The matter is engaging the careful attention of the Government.

Cripples' Hospitals.

Lord **CHARLES BERESFORD** asked the Chancellor of the Exchequer whether he was aware that at the Cripples' Hospital and College at Alton 95 per cent. of the cripples who went there were cured, who otherwise would succumb or be cripples for life; and, looking to the amount of good that this hospital did, whether he could see his way to give a State grant to the hospital and also to create hospitals of a similar character throughout the country.—Mr. **LLOYD GEORGE** answered: I am well aware of the brilliant work carried on at the hospital referred to by the noble lord. The general question of hospital accommodation is now receiving the attention of His Majesty's Government, and in the meantime I fear I can make no statement.

TUESDAY, JULY 7TH.

Sanitary Authorities in England and Wales.

Mr. **ASTOR** asked the President of the Local Government Board how many local sanitary authorities there were in England and Wales; how many medical inspectors there were in the service of the Local Government Board whose duty it was to inspect personally and keep in personal touch with the work of these authorities; and what were the other duties of these officers.—Mr. **HERBERT SAMUEL** wrote in reply: The number of sanitary authorities in England and Wales is 1870. The medical inspectors of the Local Government Board are not specially deputed to make routine inspection of the work of each of these authorities, but in the performance of their various duties, such as the holding of local inquiries, investigations into sanitary circumstances and outbreaks of disease, the inspection of vaccination, and the visiting of localities and conferences with local representatives for various other purposes, they are brought into constant touch with the sanitary authorities and their administration.

Panel Patients in Wales.

Lord **NINIAN CRICHTON-STUART** asked the honourable Member for St. George's-in-the-East whether any panel patients had been transferred from the Rhymney Valley Medical Association to the Bargoed and District Sick and Medical Aid Society after the closing of the panel list for the year on Dec. 14th, 1913; whether the latter society was an approved society and officially recognised at that date; and whether, under the circumstances, these transfers had been sanctioned.—Mr. **WEDGWOOD BENN** replied: My right honourable friend is informed by the Welsh Insurance Commissioners that the answer to the first and second parts of the question is in the negative. The third part does not, therefore, arise.

Dental Certificates.

Mr. **RAFFAN** asked the Parliamentary Secretary to the Board of Education whether a Departmental Committee had recently been appointed to consider the question of dental certificates; if so, whether the Committee had now concluded its deliberations and submitted its report, and when the publication of the report might be expected.—Mr. **TREVELYAN** replied: The answer to the first part of the question is in the affirmative. The report of the Committee will be issued very shortly.

BOOKS, ETC., RECEIVED.

PINCHIN, A. J. SCOTT, M.D.Lond., M.R.C.S., has been appointed Physician to Out-patients at the Hampstead General and North-West London Hospital.

POULTON, E. P., M.D.Oxon., M.R.C.P.Lond., has been appointed Assistant Physician to Guy's Hospital.

TODD, J. N., M.B., Ch.B.Glasg., has been appointed Anæsthetist to the Harrogate Infirmary.

Vacancies.

For further information regarding each vacancy reference should be made to the advertisement (see Index).

ARGYLL AND BUTE DISTRICT ASYLUM, Lochgilphead.—Medical Superintendent. Salary £500 per annum, with house and all extras.

BARROW-IN-FURNESS, NORTH LONSDALE HOSPITAL.—House Surgeon. Salary £[illegible] per annum, with residence, board, and laundry.

BATH, WINSLEY SANATORIUM FOR CONSUMPTION.—Assistant Resident Medical Officer, unmarried. Salary £[illegible] per annum, with board, residence, and laundry.

BEDFORD COUNTY HOSPITAL.—Assistant House Surgeon. Salary £[illegible] per annum, with board, lodging, and laundry.

BIRKENHEAD BOROUGH HOSPITAL.—Senior House Surgeon. Salary £120 per annum, with board and laundry.

BIRKENHEAD UNION INFIRMARY.—Senior Resident Assistant Medical Officer. Salary £175 per annum, with board, apartments, &c.

BIRMINGHAM, CITY FEVER HOSPITAL, Little Bromwich.—Assistant Medical Officer. Salary £200 per annum, with board, residence, and laundry.

BIRMINGHAM GENERAL DISPENSARY.—Resident Medical Officer, unmarried. Salary £240 per annum, with apartments, fire, light, and attendance.

BIRMINGHAM, JAFFRAY BRANCH OF THE GENERAL HOSPITAL, Gravelly Hill.—Resident Medical and Surgical Officer. Salary £150 per annum, with board, residence, and washing.

BIRMINGHAM AND MIDLAND EYE HOSPITAL, Church-street.—Junior House Surgeon. Salary £100 per annum, with residence, board, &c.

BIRMINGHAM, QUEEN'S HOSPITAL.—One House Physician and Two House Surgeons for six months. Salaries at rate of £50 per annum, with board, lodging, and washing.

BIRMINGHAM UNION.—Fourth Assistant Medical Officer at Dudley-road Infirmary. Salary £140 per annum. Also Assistant Medical Officer at Selly Oak Infirmary and House. Salary £150 per annum. Each with apartments, rations, laundry, and attendance.

BLACKBURN AND EAST LANCASHIRE ROYAL INFIRMARY.—Junior House Surgeon. Salary £100 per annum, with board, residence, &c.

BOLINGBROKE HOSPITAL, Wandsworth Common, S.W.—House Surgeon for six months. Salary £75 per annum, with board, residence, and laundry.

BOOTLE BOROUGH HOSPITAL.—Senior and Junior House Surgeons. Salaries £120 and £100 respectively, with residence, board, and laundry.

BRADFORD CITY HOSPITAL FOR CONSUMPTIVES.—Resident Medical Officer. Salary £200 per annum, with board and residence.

BRADFORD ROYAL INFIRMARY.—House Surgeon, unmarried. Salary £100 per annum, with board, residence, and washing.

BRISTOL ROYAL INFIRMARY.—Honorary Ophthalmic Surgeon.

BURY ST. EDMUNDS, WEST SUFFOLK GENERAL HOSPITAL.—Resident Medical Officer, unmarried. Salary £120 per annum, with board, lodging, and laundry.

BUXTON, DERBYSHIRE, DEVONSHIRE HOSPITAL.—Assistant House Physician for six months. Salary £100 per annum, with apartments, board, and laundry.

CAMBERWELL INFIRMARY AND GORDON-ROAD INSTITUTION.—Second Assistant Medical Officer. Salary £170 per annum. Also Third Assistant Officer for Infirmary. Salary £150 per annum. Each with apartments, board, and washing.

CARDIFF, KING EDWARD VII.'S HOSPITAL.—Two House Surgeons for six months. Salary at rate of £80 per annum, with board, residence, and laundry.

CARDIFF AND COUNTY PUBLIC HEALTH LABORATORY.—Bacteriologist. Salary £300 per annum.

CHELSEA INFIRMARY AND WORKHOUSE, S.W.—Medical Superintendent and Medical Officer. Salary £500 per annum, with unfurnished house, fuel, and light. Also Second Assistant Medical Officer for Infirmary. Salary £150 per annum, with board, washing, apartments, &c.

CITY OF LONDON HOSPITAL FOR DISEASES OF THE CHEST, Victoria Park, E.—House Physician for six months. Salary at rate of £75 per annum, with board, residence, and washing.

COLCHESTER, ESSEX COUNTY HOSPITAL.—House Surgeon and House Physician. Salary £100 per annum, with board, residence, and washing in each case.

CROYDON, COUNTY BOROUGH OF.—Assistant Medical Officer of Health and Assistant School Medical Officer. Salary £250 per annum.

DERBY, DERBYSHIRE ROYAL INFIRMARY.—House Physician and Assistant House Surgeon. Salaries £125 and £80 per annum respectively, with residence, board, and laundry.

DEVONPORT, ROYAL ALBERT HOSPITAL.—House Surgeon, unmarried. Salary £150 per annum, with board and laundry.

DEWSBURY UNION INFIRMARY.—Female Resident Assistant Medical Officer. Salary at rate of £100 per annum, with rations, apartments washing, &c.

ESSEX EDUCATION COMMITTEE.—Medical Inspector of School Children. Salary £300 per annum.

FALKLAND ISLANDS.—Assistant Colonial Surgeon, unmarried. Salary £400 per annum.

FAREHAM, HANTS COUNTY ASYLUM.—Third Assistant Medical Officer, unmarried. Salary £250 per annum, with apartments, board, washing, and attendance.

GLAMORGAN COUNTY COUNCIL.—Medical Officer for the Inspection of School Children. Salary £250 per annum.

GLOUCESTERSHIRE EDUCATION COMMITTEE.—School Medical Inspector. Salary £250 per annum.

GREAT NORTHERN CENTRAL HOSPITAL, Holloway-road, N.—House Surgeon, for six months. Salary £80 per annum, with board, lodging, and laundry.

GREENWICH UNION INFIRMARY AND WORKHOUSE.—First Assistant Medical Officer, unmarried. Salary £175 per annum, with apartments, rations, and washing.

GRIMSBY AND DISTRICT HOSPITAL.—Senior House Surgeon. Also Junior House Surgeon. Salaries £100 and £80 per annum respectively, with board, lodging, attendance, and washing.

HALIFAX ROYAL INFIRMARY.—Second House Surgeon and Third House Surgeon, unmarried. Salary £120 and £100 per annum respectively, with residence, board, and washing.

HERTFORDSHIRE COUNTY COUNCIL.—Assistant to Medical Officer of Health. Salary £300 per annum.

HOSPITAL FOR CONSUMPTION AND DISEASES OF THE CHEST, Brompton, S.W.—House Physician for six months. Salary 30 guineas.

HUDDERSFIELD ROYAL INFIRMARY.—Assistant House Surgeon. Salary £80 per annum, with board, rooms, and washing.

HULL ROYAL INFIRMARY.—Casualty House Surgeon. Salary at rate of £[illegible] per annum, with board and lodging. Also Assistant House Surgeon. Salary at rate of £100 per annum, with board and lodging.

HULL, VICTORIA CHILDREN'S HOSPITAL, Park-street.—Female Assistant House Surgeon. Salary £[illegible] per annum, with board and laundry.

LEEDS GENERAL INFIRMARY.—Resident Obstetric Officer for six months. Salary £[illegible] per annum, with board, residence, and laundry. Also Two House Physicians for six months, without salary, but with board, residence, and laundry.

Leeds Public Dispensary.—Junior Resident Medical Officer. Salary £130 per annum, with board, residence, and laundry.

Leicester Royal Infirmary.—Assistant House Physician for six months. Salary at rate of £100 per annum, with board, apartments, and washing.

Liverpool City Infectious Diseases Hospital.—Assistant Resident Medical Officer, unmarried. Salary £150 per annum, with board, washing, and lodging.

Liverpool, Highfield Infirmary.—Assistant Medical Officer. Salary £180 per annum, with apartments, &c.

Liverpool School of Tropical Medicine.—Research Assistant at Runcorn Research Laboratory. Salary £150 per annum.

Liverpool Stanley Hospital.—Two House Physicians and a House Surgeon. Salary £75 per annum each, with board, residence, and laundry.

London Medical Mission, Endell-street, W.C.—Resident Medical Officer, unmarried. Salary £120 per annum, with board and residence.

Lowestoft and North Suffolk Hospital.—House Surgeon, unmarried. Salary at rate of £150 per annum, with board, residence, and laundry.

Macclesfield, Cheshire County Asylum, Parkside.—Locum Tenens for about two months. Salary 5 guineas per week, with apartments, board, and washing.

Maidstone, Kent County Asylum.—Fourth Assistant Medical Officer, unmarried. Salary £250 per annum, with quarters, board, attendance, washing, &c.

Manchester, Hulme Dispensary, Dale-street, Stretford-road.—House Surgeon. Salary £180 per annum, with apartments, attendance, coal, and gas.

Manchester Northern Hospital for Women and Children, Park-place, Cheetham Hill-road.—House Surgeon. Salary £120 per annum, with apartments and board.

Manchester, St. Mary's Hospitals for Women and Children.—House Surgeon for Children's Department. Also House Surgeon for Obstetrical and Gynæcological Departments. Each for six months. Salary £25 per annum each, with board and residence.

Newark-upon-Trent Hospital.—Female Resident Medical Officer, unmarried. Salary £120 per annum, with board, lodging, and laundry.

Northampton General Hospital.—Two House Surgeons, unmarried. Salary £120 per annum each, with apartments, board, washing, attendance, &c.

Norwich, Jenny Lind Hospital for Sick Children.—Resident Medical Officer for six months. Salary £80 per annum, with board, apartments, and laundry.

Nottingham General Dispensary.—Assistant Resident Surgeon, unmarried. Salary £180 per annum, with apartments (not board), attendance, light, and fuel.

Nottingham General Hospital.—Assistant House Physician for six months. Salary at rate of £100 per annum, with board, residence, and laundry.

Ogmore and Garw Urban District Council.—Medical Officer of Health. Salary £325 per annum.

Peterborough Infirmary and Dispensary.—House Surgeon, unmarried. Salary at rate of £120 per annum, with residence, board, and laundry.

Plymouth, South Devon and East Cornwall Hospital.—House Physician for six months. Salary £90 per annum, with board, residence, and washing.

Poplar Hospital for Accidents, Poplar, E.—Assistant House Surgeon for six months. Salary at rate of £20 per annum, with board and residence.

Portsmouth Royal Hospital.—House Surgeon for six months. Salary £90 per annum, with board, &c.

Portsmouth Workhouse Infirmary, Workhouse, and Children's Home.—Second Assistant Resident Medical Officer, unmarried. Salary £150 per annum, with apartments, rations, &c.

Preston County Borough.—School Medical Officer. Salary £350 per annum.

Prince of Wales's General Hospital, Tottenham, N.—Junior House Physician and Junior House Surgeon for six months. Salary £75 per annum each, with residence, board, and laundry.

Queen's Hospital for Children, Hackney-road, Bethnal Green, E.—House Surgeon for six months. Salary £80 per annum, with board, residence, and washing.

Ramsgate General Hospital and Dispensary.—Resident House Surgeon, unmarried. Salary £100 per annum, with board, residence, and laundry.

Rochdale Infirmary and Dispensary.—Senior House Surgeon, unmarried. Salary £120 per annum, with board, residence, and laundry.

Royal Army Medical Corps.—Twelve Commissions.

Royal Ear Hospital, Soho.—House Surgeon. Salary £40 per annum.

Royal Hospital for Diseases of the Chest, City-road, E.C.—Resident Medical Officer. Also House Physician. Both for six months. Salaries at rate of £120 and £60 per annum respectively, with board, lodging, and washing.

Royal Naval Medical Service.—Twenty-five Appointments.

Royal Waterloo Hospital for Children and Women, S.E.—Surgeon to Out-patients. Also Junior Resident Medical Officer. Salary at rate of £50 per annum, with board and washing.

Royal Westminster Ophthalmic Hospital, King William-street, West Strand, W.C.—Assistant Surgeon.

St. Mary's Hospital, Paddington, W.—Resident Assistant Anæsthetist for six months. Salary at rate of £100 per annum, with board and residence.

St. Mary's Hospital for Women and Children, Plaistow, E.—Assistant Resident Medical Officer. Salary at rate of £100 per annum, with board, residence, and laundry.

Salford Royal Hospital.—House Surgeon, Junior House Surgeon, and Casualty House Surgeon. Salary at rate of £100 per annum each, with board and residence.

Scarborough Hospital and Dispensary.—Senior and Junior House Surgeons. Salaries £100 and £50 per annum respectively, with board, residence, &c.

Sheffield, East End Branch of the Children's Hospital (Out-patient Department).—House Surgeon. Salary £120 per annum, with board and residence.

Sheffield, Jessop Hospital for Women.—Senior and Junior Female House Surgeons, unmarried. Salaries £100 and £50 per annum respectively, with board, residence, and laundry.

Shrewsbury, Salop Infirmary.—House Physician. Salary at rate of £110 per annum, with board and apartments.

Somerset County Council.—Assistant Tuberculosis Officer. Salary £300 per annum.

South Shields, Ingham Infirmary and South Shields and Westoe Dispensary.—Junior House Surgeon. Salary £115 per annum, with residence, board, and washing.

Surrey County Council.—Assistant Medical Officer of Health. Salary £400 per annum.

Swansea General and Eye Hospital.—Two House Surgeons. Salary £125 per annum, with board, washing, and attendance. Also House Physician. Salary £125 per annum, with board, apartments, and laundry.

Throat Hospital, Golden-square, W.—Two Resident House Surgeons. Salary £75 per annum, with board, residence, &c.

Truro, Royal Cornwall Infirmary.—House Surgeon, unmarried. Salary £100 per annum, with rooms, board, and washing.

Victoria Hospital for Children, Tite-street, Chelsea, S.W.—House Physician and House Surgeon for six months. Salary £40, with board and lodging.

Walsall and District Hospital.—Assistant House Surgeon. Salary £110 per annum, with board, residence, and laundry.

Wandsworth Union Infirmary, Ouseley-road, Balham, S.W.—Senior Assistant Medical Officer, unmarried. Salary at rate of £150 per annum, with board, lodging, and washing.

West Bromwich, County Boroughs of Walsall and West Bromwich.—Tuberculosis Officer. Salary £500 per annum.

West Bromwich and District Hospital.—Assistant Resident House Surgeon and Anæsthetist, unmarried. Salary £100 per annum, with board, residence, and washing.

West Ham, County Borough of.—Assistant School Medical Officer. Salary £250 per annum.

West Ham and Eastern General Hospital.—Junior House Physician and Junior House Surgeon. Salary at rate of £75 per annum, with board, residence, and washing.

West Hartlepool, Cameron Hospital.—House Surgeon, unmarried. Salary £150 per annum, with board and rooms.

West London Hospital, Hammersmith-road, W.—Resident Casualty Officer and Anæsthetist. Salary at rate of £40 per annum, with board, lodging, washing, &c.

Weston-super-Mare Hospital.—House Surgeon, unmarried. Salary £120 per annum, with residence, board, and laundry.

Winchester, Royal Hampshire County Hospital.—House Physician. Salary £80 per annum.

Wrexham Infirmary.—Resident House Surgeon. Salary £120 per annum, with board, lodging, and washing.

The Chief Inspector of Factories, Home Office, London, S.W., gives notice of vacancies for Certifying Surgeons under the Factory and Workshop Acts at Shardlow, in the county of Derby; at Malton, in the county of York; and at Runcorn, in the county of Chester.

Births, Marriages, and Deaths.

BIRTHS.

Booth.—On July 8th, at 78, Southampton-street, Reading, the wife of Norman Booth, M.B., B.S. Lond., of a son.

Goodman.—On June 28th, at Powderham-crescent, Exeter, the wife of W. H. Goodman, L.D.S. R.C.S. Eng., of a daughter.

King.—On June 17th, at Castries, St. Lucia, B.W.I., the wife of Alex. King, M.B., of a son.

Marshall.—On July 4th, at Old Court, Ealing, the wife of C. P. Marshall, M.D., F.R.C.S., of a son.

Pineo.—On June 29th, at Richmond House, Langford, Somerset, the wife of Ernest D. Pineo, M.R.C.S., L.R.C.P., of a daughter.

Sandiland.—On July 3rd, at the City of Westminster Infirmary, South Kensington, the wife of Digby S. Sandiland, M.R.C.S., L.R.C.P., of a daughter.

MARRIAGES.

Cane—Guyot.—On July 4th, at St. Martin's-in-the-Fields, Trafalgar-square, Lionel Charles William Cane, M.R.C.S., L.R.C.P., to Doris, eldest daughter of Mr. and Mrs. Guyot, of Belvedere, Kent.

Hughes—Reeves-Smith.—On July 2nd, at St. George's, Hanover-square, Basil Hughes, F.R.C.S., to Janet, only daughter of Mr. and Mrs. Reeves-Smith, of Berkeley-street, W.

Pearson—Stanley.—On July 1st, at the Parish Church, Edgbaston, Dudley Garencières Pearson, M.B., M.R.C.S., L.R.C.P., to Annie Gordon, eldest daughter of William Stamer Stanley.

DEATHS.

Burgess.—On June 10th, at Darjeeling, India, John Hay Burgess, M.D., M.R.C.P. Lond., F.R.C.S. Eng., Captain, I.M.S., Surgeon to His Excellency the Governor of Bengal, aged 3[illegible] years.

Coleman.—On July 6th, at Epsom, Charles Alfred Coleman, M.D., aged 65 years.

Laidlaw.—On July 2nd, at Grantchester Meadows, Cambridge, Robert Laidlaw, M.D., F.R.C.S. Edin., in his 73rd year.

Rose.—On July 1st, at Warwick-avenue, Maida-hill West, W., Henry Cooper Rose, M.D., Surgeon-Major, and of the Middle Temple, Barrister-at-law, aged 83 years.

Vachell.—On July 2nd, at a nursing home at Clifton, Charles Tanfield Vachell, M.D. Lond., of Cardiff, aged 66 years.

N.B.—A fee of 5s. is charged for the insertion of Notices of Births, Marriages, and Deaths.

Notes, Short Comments, and Answers to Correspondents.

AN INTERESTING HOSPITAL.

A CORRESPONDENT writes us an account of the hospital which the Roman Catholic Sisters of Providence have built recently in Seattle, State of Washington, U.S.A. The hospital of 375 beds cost a million dollars, and contains a certain number of free beds and others for which £2 a week (in room with four to six beds) and upwards are asked. There are large private rooms, with bathroom *en suite*, which cost £8 a week, and, in addition, patients pay from 5 to 10 dollars for the use of the operation room if required, and in every case the fees of the patient's physician who has sent him into this hospital are to be paid in addition. The hospital is a good type of the modern paying institution, and is nursed by 50 religieuses and 80 nurses, mostly pupils undergoing a three years' course of training.

"An ambulance brings the patient to a door on the ground floor," writes our correspondent, "but you, as a visitor, will mount a flight of steps that covers this lower door, and you will enter a spacious white-tiled hall on the first of the six floors of the building. The surgical suite is on the uppermost floor, where there are eight operation rooms with excellent light from roof and side, and separated by well-equipped sterilising rooms, while in an anteroom are tanks for the after-washing of all appliances used in the operation. There are also a dressing-room for the surgeons, X ray and ophthalmoscope room, and anæsthetising rooms. The wards have never more than six beds, generally less, and in the private rooms there is always a wardrobe sunk in the wall. The floors are of hard wood, corners always rounded, the doors are smooth, and the mouldings very low and rounded. Lighting is by overhead lamps concealed inside sanded glass globes, in addition a light on the wall. Each patient has a signal for the nurse, which lights a green lamp over the door, easily conspicuous in the spacious white-tiled corridor; other lights—one in the nurses' duty room and one in the superintendent nurse's office—are extinguished by the nurse when she goes to the patient. There are also red lights in the corridors, indicating the position of the wide fire-escapes. The hospital is built of fireproof cement concrete."

In illustration of the care taken in the preparation and distribution of the food, our correspondent writes: "In each section there is a diet kitchen, to which the food is brought from the main kitchen by a small lift. Here it is transferred to a steam-carving table, where it is portioned out and put on trays, with clean linen and attractive crockery. On a dresser for these trays, when not in use, there are numbers for each bed served, and the tray appropriate is placed there. The sisters here well support their traditional credit for serving appetising meals." Of the engine-room he says: "Three oil-fired Babcock and Wilcox water-tube boilers of 200 h.p. each provide steam to drive dynamos for the electric light. This installation makes electricity at six-tenths of a halfpenny per kilowatt, and the exhaust steam heats the building at 7½d. per square foot of heating surface over the 40,000 square feet of radiators in the building. The heat is regulated from the engine-room, but in every room there is an automatic regulator which keeps the temperature constant as desired. If the room is to be warmer, the valve admits more steam to the radiators and *vice versâ*. No fire is there in the hospital outside the power house, and gas is only used in the baking ovens and grill. The engine-room does a great deal for the hospital, and does it to the satisfaction of everyone. It takes the local water, filters it, and pumps it through the building, besides storing it under pressure for fire protection (supply of 500 gallons a minute) in case pressure in the town supply falls at a crisis. The engine-room makes 500 lb. of ice per day, and besides supplies iced water at 37° (40° in the wards) for drinking; ice is never allowed into the drinks. It also supplies cooled brine to all the refrigerators through the diet kitchens and the main kitchen where they are large like caves; some of the smaller have glass linings; the largest is tiled. Steam is also used for cooking at 250 lb. Even roasting is thus done (it seems to take twice as much steam as boiling), and the sister who took me round declared the meat thus roasted was far better cooked than that out of an ordinary roasting oven. She showed me with pride, too, the racks of bottles of preserved fruit they had prepared in the summer, when perhaps they might get a carload (some ten tons of peaches, for example, when the sisters in their hours would peel and stone them, for nothing is wasted.)

"The requisite air for ventilation is taken in through tempering coils, washed as it passes through a 7' × 9' screen of bronze gauze and distributed by two No. 14 Sirocco fans each delivering 41,000 cubic feet per minute, but each capable of doing the full work if one breaks down. From the plenum chamber the air is conveyed to the hospital by two passages 50" × 74" and by a third 84" × 40". High-pressure steam is supplied for the kitchen, also for steam-carving tables, sterilisers, and disinfectors, and low pressure for blanket warmers and mop driers. The pressure-water system keeps a constant flush going in the water closets, and the hot water-supply to lavatories. Another set of pipes to the engine-room serves the vacuum cleaners; their dust comes down to the engine-room and is burnt with other rubbish in an oil-fired destructor. Electric power supplies light, power for laundry, for the two large elevators and seven dumb waiters, and for the announcement service (the green light), which is worked through small accumulators; the large accumulators are always charged to prevent light failing in an operating theatre during an operation. This reminded one of the provision of portable electric lights with batteries in German battleships in case of failure of light during action. Telephones connected with the city system are everywhere and also a private installation which rings calls throughout the hospital, calls which vary according to the particular high official whose presence is needed. In the office is a master clock which every minute sends round a current which moves through one minute the hands on each of the 41 dials it controls in the hospital, and, in addition, makes the meal and other signals required to indicate that duty at this moment necessary."

"So well thought out is the whole scheme," concludes our correspondent, "you do not even have to go down to the office to pay your bill, but it is enclosed in the office in a carrier which is blown up to you through a pneumatic tube which later brings you back your change before, grateful and recovered, you leave this excellent and airy hospital from which you get, besides, so fine a view over beautiful Puget Sound."

NUMBER OF DOCTORS ON THE PANEL.

To the Editor of THE LANCET.

SIR,—In THE LANCET of Feb. 21st, 1914, p. 580, you reported under Parliamentary Intelligence the reply of the Secretary to the Treasury as to the numbers of medical men on panels in England, Scotland, and Wales respectively as follows. "Mr. Wedgwood Benn: The approximate numbers of medical men on panels in England, Scotland, and Wales respectively are 16,300, 2700, and 1250 respectively, including medical men who are on more than one panel." These figures produce a total of 20,250 panel men. I observe that at the dinner of the National Medical Union, held on June 27th, 1914, it was stated that there are only 14,472 panel men. If this latest total is right, and there are actually only that number of individual men on the panel, then I suppose it would be correct to assume that there are 5778 names of medical men on panels which are duplications, or triplications, or so on (the difference between 20,250 names and 14,472 individuals). I wish to make a note of the figures for reference purposes.

I am, Sir, yours faithfully,

London, June 29th, 1914. ENQUIRER.

⁂ We see no other way to reconcile two statements, which apparently vary, while each was made with a sense of responsibility.—ED. L.

"DIE BUCHE SUCHE."

To the Editor of THE LANCET.

SIR,—Dr. F. S. Arnold will find some statistics of the relative frequency with which the beech and other trees are struck by lightning, as well as a good deal of other information on the subject, in the late Sir Jonathan Hutchinson's *Haslemere Museum Gazette*, Volume I., published by John Bale and Sons, London, pp. 118 and 202, &c.

I am, Sir, yours faithfully,

Seymour-street, W. E. MUIRHEAD LITTLE.

ARSENIC IN POTASSIUM CARBONATE.

AT the Manchester police court on June 16th six chemists were summoned at the instance of the Lancashire county council for an offence under the Food and Drugs Act—viz., selling on April 23rd salt of tartar not of the nature and quality demanded, inasmuch as the salt contained arsenic. The prosecutor made a statement as to the facts, and then asked the bench to allow the cases to be withdrawn, the defendants agreeing to pay the cost. Salt of tartar is known as carbonate of potassium, and there are several ways of manufacturing it. The old way was to make it from wood ash, when there was no risk of arsenic contamination. It is now made in England from a salt which comes from Germany. In the process this salt is treated with sulphuric acid, which it is well known often contains arsenic, and it was suggested that in that way the arsenic got into the carbonate of potassium.

The quantity of arsenic found varied from 9·5 grains to 4·5 grains per pound. Among 79 samples recently analysed by the county analyst only 23 were found free from arsenic, while the other samples contained from 1 grain to 14·5 grains per pound. The prosecutor believed that the defendants sold the salt not knowing it to be adulterated. But none of the defendants had any reason to suspect the presence of arsenic in the salt. They were all buying from reputable wholesale firms, who themselves had no suspicion. In the British Pharmacopœia itself there is no warning at all that arsenic may be an impurity.

WANTED—A HOME.

To the Editor of THE LANCET.

SIR,—Could any of your readers inform me where a gentleman would be taken into a home or family in a quiet country district or the seaside for the inclusive fee of 21s. per week? He is quite able to look after himself, and would not require any special care or nursing.

I am, Sir, yours faithfully,
J. POLLOCK SIMPSON, M.D.
8, Upper Montagu-street, W., July 2nd, 1914.

To the Editor of THE LANCET

SIR,—Can any of your readers recommend a convalescent home for a lady, where the services of a nurse can be obtained? Terms must be moderate. S.E. coast preferred.

I am, Sir, yours faithfully,
W. H. FROME YOUNG, M.R.C.S.Eng.
Bembridge, I.W., July 3rd, 1914.

FORCIBLE FEEDING.

A LETTER signed by 70 registered medical men objecting "to the forcible feeding as carried out in His Majesty's prisons" has been forwarded to the Home Secretary, with a request that Mr. McKenna will receive a deputation on the subject.

FLIES AND AERATED WATERS IN STOPPERED BOTTLES.

To the Editor of THE LANCET.

SIR,—The other day I sent for a bottle of lemonade and noticed all around the mouth of the stoppered bottle evidence of filth deposited there by flies. It is clear that the flies had been attracted by the remaining saccharine matter. This would, of course, also apply to the mouths of syphons. I write this letter in order that some inventive genius may bring forward a stopper—a simple matter—which will cover as a shield the aperture of the bottle and prevent flies depositing their filth there. A paper cover over the stopper could be used for bottles—as in the case of a well-known brand of bottled beer—and a small metal shield or cap, with chain, for syphons. It must be patent to everyone that if some protection is not made when the fluid is poured out of the bottle or syphon the filth of the flies must become mixed with it.

I am, Sir, yours faithfully,
July 3rd, 1914. A MEDICAL OFFICER OF HEALTH.

"BIOMALZ."

IN the analysis of the above preparation, a combination of malt extract with calcium glycerophosphate, we reported in THE LANCET of May 9th, 1914, that the percentage of moisture was 37·83. Two recent samples have since been examined, and the results showed a perceptible reduction in the amount of moisture—viz., 34·93 per cent. and 34·94 per cent. respectively.

ERRATUM.—In Dr. E. G. Fearnside's article in THE LANCET of last week on Diseases of the Pituitary Gland the acknowledgment to Mr. F. S. Kidd on page 23 should have been to Dr. Percy Kidd; while the author wishes to make acknowledgment also to Dr. Theodore Thompson.

COMMUNICATIONS not noticed in our present issue will receive attention in our next.

A DIARY OF CONGRESSES.

The following Congresses, Conferences, and Exhibitions are announced.

In 1914:—

May 1st–Nov. 1st (Lyons).—International Town Hygiene Exhibition.
" 15th–Oct. 15th (Berne).—Swiss National Exhibition.
May–October (London, Shepherd's Bush).—Anglo-American Exposition.
June–July (Groningen).—University of Groningen 300th Anniversary Celebration.
July 6th–11th (Blackpool).—Twenty-ninth Congress of the Royal Sanitary Institute.
" 15th–20th (Edinburgh).—Congress of the Royal Institute of Public Health.
" 21st–23rd (Chester).—British Pharmaceutical Conference.
" 27th–31st (London).—Fifth Annual Session of the Clinical Congress of Surgeons of North America.
" 28th–31st (Aberdeen).—Eighty-second Annual Meeting of the British Medical Association.
July–September (Australia).—Eighty-fourth Annual Meeting of the British Association for the Advancement of Science. (July 28th to August 3rd at Perth, August 8th to 12th at Adelaide, August 13th to 19th at Melbourne, August 20th to 26th at Sydney, August 27th to Sept. 1st at Brisbane).
Aug. 2nd–10th (Paris).—Tenth Congress of Esperantists.
" 3rd–8th (London).—Sixth International Dental Congress.
" 10th–15th (St. Petersburg).—Twelfth International Congress of Ophthalmology.
" 29th–Sept. 14th (Toronto).—Canadian National Exhibition.
Sept. 7th–12th (Berne).—International Congress for Neurology Psychiatry, and Psychology.
" 10th–12th (Fort William and Port Arthur, Ontario).—Fourth Annual Congress of the Canadian Public Health Association.
" 21st–26th (Victoria, B.C.).—Dominion Exhibition.
" 21st–26th (Vienna).—Third International Congress on Diseases of Occupation.
" 30th–Oct. 4th (Brussels). Fourteenth French (de langue française) Congress of Medicine.
Oct. 31st–Nov. 2nd (Berlin).—First Congress of the International Society for Sexual Research.
Nov. 15th–21st (London).—Health Week. (Under the direction of the Health Week Committee appointed by the Royal Sanitary Institute.)

Medical Diary for the ensuing Week.

LECTURES, ADDRESSES, DEMONSTRATIONS, &c.

MEDICAL GRADUATES' COLLEGE AND POLYCLINIC, 22, Chenies-street, W.C.

MONDAY.—4 P.M., Dr. D. Corbett: Clinique (Skin). 5.15 P.M., Lecture:—Dr. T. D. Lister: Artificial Pneumothorax.

TUESDAY.—4 P.M., Dr. E. H. Shaw: Clinique (Medical). 5.15 P.M., Lecture:—Dr. J. D. Mortimer: The Medico-Legal Position of the Anæsthetist.

WEDNESDAY.—4 P.M., Mr. A. E. Johnson: Clinique (Surgical). 5.15 P.M., Lecture:—Dr. J. D. Windle: Some Modes of Respiration in Pneumonia (lantern demonstration).

THURSDAY.—4 P.M., Mr. G. Taylor: Clinique (Surgical). 5.15 P.M., *Lecture:—Dr. S. R. Wells: Certain Irregularities of the Pulse.*

FRIDAY.—4 P.M., Mr. E. A. Peters: Clinique (Ear, Nose, and Throat).

POST-GRADUATE COLLEGE, West London Hospital, Hammersmith-road, W.

MONDAY.—10 A.M., Dr. Simson: Diseases of Women. 10.30 A.M., Medical Registrar: *Demonstration of Cases in Wards.* 12 noon, Dr. Bernstein: Pathological Demonstration. 2 P.M., Medical and Surgical Clinics. X Rays. Mr. D. Armour: Operations. Dr. Pritchard: Bacterial Therapy Department. Mr. B. Harman and Mr. Gibb: Diseases of the Eye. 5 P.M., Lecture:—Mr. T. Gray: Some Surgical Aspects of Indigestion.

TUESDAY.—10 A.M., Dr. Robinson: Gynæcological Operations. *Dr. Owen: Demonstration of Cases in Wards.* 12 noon, Mr. T. Gray: Demonstration of Fractures, &c. 2 P.M., *Medical and Surgical Clinics. X Rays. Mr. Baldwin: Operations.* Dr. Davis: Diseases of the Throat, Nose, and Ear. Dr. Pernet: Diseases of the Skin. 5 P.M., *Clinical Lecture:—Dr. Davis:* Diseases of the Ear.

WEDNESDAY.—10 A.M., Dr. Saunders: Diseases of Children. Dr. Davis: Operations of the Throat, Nose, and Ear. 11 A.M. Mr. Souttar: Demonstration of Minor Operations. 12 noon Lecture:—Mr. Souttar: Abdominal Diagnosis. 2 P.M., Medical and Surgical Clinics. X Rays. Mr. Pardoe: Operations. *Dr. Simson: Diseases of Women.* Mr. Gibb: Diseases of the Eye. 5 P.M., Lecture:—Dr. Bernstein: Pyrexia.

THURSDAY.—9 A.M., Dr. Bernstein: *Bacterial Therapy Department.* Dr. Simson: Gynæcological Demonstration. 12 noon, Lecture:—Dr. G. Stewart: *Neurological Cases.* 2 P.M., Medical and Surgical Clinics. X Rays. Mr. D. Armour: Operations. Mr. B. Harman: Diseases of the Eye. 5 P.M., Lecture:—Dr. Bernstein: Pyrexia.

FRIDAY.—10 A.M., Dr. Robinson: Gynæcological Operations. 10.30 A.M., Surgical Registrar: Demonstration of Cases in Wards. 12.15 P.M., Lecture:—Dr. Bernstein: Applied Pathology. 2 P.M., Medical and Surgical Clinics. X Rays. Mr. Baldwin: Operations. Dr. Davis: *Diseases of the Throat, Nose, and Ear.* Dr. Pernet: *Diseases of the Skin.* 5 P.M., *Lecture:—Dr. Bernstein:* Bacillus Coli Infections.

SATURDAY.—10 A.M., Dr. Saunders: Diseases of Children. Dr. Davis: Operations of the Throat, Nose, and Ear. Mr. B. Harman: Operations of the Eye. 12 noon, *Lecture:—Mr. T. Gray:* Surgical Anatomy of the Abdomen. 2 P.M., Medical and Surgical Clinics. X Rays. Mr. Pardoe: Operations.

NORTH-EAST LONDON POST-GRADUATE COLLEGE, Prince of Wales's General Hospital, Tottenham, N.

MONDAY.—Clinics:—10.30 A.M., Surgical Out-patient (Mr. E. Gillespie). 2.30 P.M., Medical Out-patient (Dr. T. R. Whipham); Gynæcological (Dr. Banister). 3 P.M., Medical In-patients (Dr. R. M. Leslie).

TUESDAY.—2.30 P.M., Operations. Clinics:—Medical Out-patient (Dr. A. G. Auld); Surgical (Mr. Howell Evans); Nose, Throat, and Ear (Mr. H. D. Gillies). X Ray and Electrical Methods (Dr. Metcalfe). 3.30 P.M., Medical In-patient (Dr. A. J. Whiting).

WEDNESDAY.—Clinics:—2 P.M., Throat Operations (Mr. Gillies). 2.30 P.M., Children's Out-patient (Dr. T. R. Whipham); Skin (Dr. G. N. Meachen); Eye (Mr. [illegible]).

THURSDAY.—2.30 P.M., Gynæcological Operations (Dr. A. E. Giles). Clinics:—Medical Out-patient (Dr. A. J. Whiting); Surgical (Mr. Carson); X Rays and Electrical Methods (Dr. Metcalfe).

FRIDAY.—2.30 P.M., Operations. *Clinics:—Medical Out-patient* (Dr. A. G. Auld); Surgical (Mr. E. Gillespie); Eye (Mr. R. P. Brooks). 3 P.M., Medical In-patient (Dr. G. P. Chappel).

ROYAL HOSPITAL FOR DISEASES OF THE CHEST, Medical School, City-road, E.C.

MONDAY.—1.30 P.M., Department for the Prevention of Consumption. 2 P.M., Cardiac Department, Dr. Stott; Out-patient Department, Dr. Phear, Dr. S. Thompson. 3 P.M., Wards, Dr. Phear.

TUESDAY.—9 A.M., Laryngological Department, Mr. Mant. 1.30 P.M., Department for the Prevention of Consumption. 2 P.M., Out-patient Department, Dr. M. Leslie, Dr. B. King; Operations, Mr. A. Evans. 3 P.M., Wards, Dr. White. 4 P.M., Wards, Dr. M. Leslie.

WEDNESDAY.—2 P.M., Wards, Dr. A. Davies; Out-patient Department, Dr. Drysdale, Dr. Kellie. 4 P.M., Wards, Dr. Drysdale. 4.30 P.M., Roentgen Ray Department, Dr. Jordan.

THURSDAY.—9.30 A.M., Dental Department, Mr. G. Thomson. 10 A.M., Cardiac Department, Dr. Stott. 1.30 P.M., Department for the Prevention of Consumption. 2 P.M., Out-patient Department, Dr. Phear, Dr. S. Thompson. 4.30 P.M. Laryngological Department, Mr. Mant.

FRIDAY.—1.30 P.M., Department for the Prevention of Consumption. 2 P.M., Wards, Dr. Calvert; Out-patient Department, Dr. M. Leslie, Dr. B. King. 5 P.M., Lecture-Demonstration:—Dr. Kellie: Broncho-pneumonia.

SATURDAY.—10 A.M., Out-patient Department, Dr. Drysdale, Dr. Kellie. 11.30 A.M., Roentgen Ray Department, Dr. Jordan.

HOSPITAL FOR CONSUMPTION AND DISEASES OF THE CHEST, Brompton, S.W.

WEDNESDAY.—4.30 P.M., Dr. Burrell: Treatment with Tuberculin of Tuberculosis in Children.

CITY OF LONDON HOSPITAL FOR DISEASES OF THE CHEST, Victoria Park, E.

Course of Demonstrations for Post-Graduates:—

FRIDAY.—4 P.M., Dr. S. R. Gloyne: The Use of Tuberculin. (Laboratory demonstration.)

CENTRAL LONDON THROAT, NOSE, AND EAR HOSPITAL, Gray's Inn-road, W.C.

TUESDAY.—3 P.M., Mr. Stuart-Low: Diseases of the Ear.

THE THROAT HOSPITAL, Golden-square, W.

MONDAY.—5.15 P.M., Special Demonstration of Selected Cases.

THURSDAY.—5.15 P.M., Clinical Lecture.

MANCHESTER HOSPITALS POST-GRADUATE CLINICS.

TUESDAY.—MANCHESTER AND SALFORD HOSPITAL FOR SKIN DISEASES, Quay-street.—4.30 P.M., Dr. W. Dyson: Bullous and Erythematous Diseases of the Skin.

WEDNESDAY.—ROYAL INFIRMARY—4.30 P.M., Dr. Brockbank: Cases of Anæmia and a Simple Method of Blood-examination.

THURSDAY.—ANCOATS HOSPITAL—4.30 P.M., Demonstration of Cases by Medical Staff.

For further particulars of the above Lectures, &c., see Advertisement Pages.

EDITORIAL NOTICES.

IT is most important that communications relating to the Editorial business of THE LANCET should be addressed *exclusively* "TO THE EDITOR," and not in any case to any gentleman who may be supposed to be connected with the Editorial staff. It is urgently necessary that attention should be given to this notice.

Cases for binding the half-year's numbers are now ready. Cloth, gilt lettered, price 2*s.*, by post 2*s.* 3*d.*

To be obtained on application to the Manager, accompanied by remittance.

TO SUBSCRIBERS.

WILL Subscribers please note that only those subscriptions which are sent direct to the Proprietors of THE LANCET at their Offices, 423, Strand, London, W.C., are dealt with by them? Subscriptions paid to London or to local newsagents (with none of whom have the Proprietors any connexion whatever) do not reach THE LANCET Offices, and consequently inquiries concerning missing copies, &c., should be sent to the Agent to whom the subscription is paid, and *not* to THE LANCET Offices.

Subscribers, by sending their subscriptions direct to THE LANCET Offices, will ensure regularity in the despatch of their Journals and an earlier delivery than the majority of Agents are able to effect.

THE COLONIAL AND FOREIGN EDITION (printed on thin paper) is published in time to catch the weekly Friday mails to all parts of the world.

The rates of subscriptions, post free from THE LANCET Offices, have been reduced, and are now as follows:—

FOR THE UNITED KINGDOM.		TO THE COLONIES AND ABROAD.	
One Year	£1 1 0	One Year	£1 5 0
Six Months	0 12 6	Six Months	0 14 0
Three Months	0 6 6	Three Months	0 7 0

(The rate for the United Kingdom will apply also to Medical Subordinates in India whose rates of pay, including allowances, is less than Rs.50 per month.)

Subscriptions (which may commence at any time) are payable in advance. Cheques and Post Office Orders (crossed "London County and Westminster Bank, Covent Garden Branch") should be made payable to the Manager, Mr. CHARLES GOOD, THE LANCET Offices, 423, Strand, London, W.C.

TO COLONIAL AND FOREIGN SUBSCRIBERS.

SUBSCRIBERS ABROAD ARE PARTICULARLY REQUESTED TO NOTE THE RATES OF SUBSCRIPTIONS GIVEN ABOVE.

The Manager will be pleased to forward copies direct from the Offices to places abroad at the above rates, whatever be the weight of any of the copies so supplied.

SOLE AGENTS FOR AMERICA—MESSRS. WILLIAM WOOD AND CO., 51, Fifth Avenue, New York, U.S.A.

Communications, Letters, &c., have been received from—

A.—Messrs. Allen and Hanburys, Lond.; Dr. F. W. Alexander, Lond.; Mr. F. Ackery, Lond.; Argyll and Bute District Lunatic Asylum, Lochgilphead, Secretary of; Anderson College of Medicine, Glasgow, Secretary of; A. H. T.; Messrs. Arnold and Sons, Lond.; Anglo-American Pharmaceutical Co., Lond.; Apollinaris Co., Lond.

B.—Dr. M. C. Blair, Edinburgh; Mr. J. C. Barker, Watford; Dr. J. Biernacki, Lond.; Mr. H. Bazett, Lond.; Mrs. Burgess, Governor's Camp, Bengal; Dr. S. N. Bruce, Lond.; Dr. F. E. Batten, Lond.; Messrs. A. Burbridge and Co., Lond.; Messrs. Butterworth and Co., Lond.; Messrs. A. Bishop, Lond.; Dr. J. Linton Bogle, Matlock; Birmingham General Hospital, Secretary of; Dr. A. G. Bateman, Lond.; Blackburn and East Lancashire Infirmary, Blackburn, Secretary of; Birkenhead Union, Clerk to the.

C.—Chelsea Guardians, Clerk to the; Dr. G. Crichton, Lond.; Sanitätsrat Dr. Eugen Cohn, Berlin; Messrs. Clayton, Lond.; Dr. Albert Chalmers, Khartoum; Dr. Raymond Crawfurd, Lond.; Dr. Leonard Colebrook, Lond.; Dr. A. E. Carver, Birmingham; Dr. J. B. Christopherson, Khartoum; Dr. A. N. S. Carmichael, Edinburgh; Messrs. Corbyn, Stacey and Co., Lond.; Messrs. T. Cook and Son, Lond.; Camberwell Guardians, Lond., Clerk to the; Cheshire County Asylum, Macclesfield, Clerk to the; Dr. Robert Carswell, Lond.

D.—Messrs. W. Dawson and Sons, Lond.; Dr. R. Davies, Bucharest; Mr. J. L. Dick, Lond.; Derbyshire Royal Infirmary, Derby, Sec. of.

ABSTRACT OF

The Bolingbroke Lecture

ON

PROGNOSIS.

Delivered before the South-West London Medical Society on June 10th, 1914,

By W. HALE WHITE, M.D. Lond.,
F.R.C.P. Lond.,
SENIOR PHYSICIAN TO GUY'S HOSPITAL.

Mr. President and Gentlemen,—When your secretary did me the honour of inviting me to address you, he asked that the paper might be concerned with something that would especially interest those whose work is chiefly clinical. Now we have to find out what is the matter with our patients, to treat them, and to try to foretell what the result of their illness will be, and it is with prognosis that I propose to deal chiefly. Of the importance of it there is no doubt; patients' friends do not care what is the matter, or what you do—all they care is will the sufferer get well. Hippocrates said: "The best physician is the one who is able to establish a prognosis, penetrating and exposing first of all at the bedside the present, the past, and the future of his patients, and adding what they omit in their statements. He gains their confidence, and being convinced of his superiority of knowledge they do not hesitate to commit themselves entirely into his hands. He can treat, also, so much better their present condition in proportion as he shall be able from it to foresee the future."

The art of prognosis is as old as the hills and has probably existed as long as the human race. Astrologers were constantly attempting to find out if patients would get well. To quote from Dr. C. A. Mercier's FitzPatrick lectures recently published[1]: "If the moon should be in conjunction with a propitious planet in the ascendant, and should be moving forward and her light waxing, and both should be free from adverse influences, then the disease will be quickly cured; but if the moon should be in the House of Death the patient cannot be saved." However, to leave these fanciful speculations and to turn to modern prognosis. Obviously we cannot discuss the prognosis of every disease, but let us take a few of the commoner.

Prognosis in Syphilis.

Syphilis has been much before the profession lately, and it has been shown that it is considerably more far-reaching in its effects than was formerly thought. If there were no syphilis there would be no tabes dorsalis and no general paralysis. Further, both these diseases may occur in children and be due to congenital syphilis, and some of the many mentally deficient children may owe their trouble to congenital syphilis. Then, although syphilis is not the only cause of atheroma, for atheromatous vessels are found in Egyptian mummies of about 1000 B.C., which is long before syphilis had been introduced into the old world, yet it is a cause for some cases of atheroma, and if you will have a Wassermann reaction done on all cases of atheroma of the aortic valves you will sometimes find it positive when there is no other evidence of syphilis. Without mentioning other results of syphilis it is clear that it is most important to try to foretell the outlook of this disease.

Now it used to be taught that if a patient had had two years' continuous treatment he might be regarded as cured, but we all often come across cases which show that this is certainly not always true, and the following figures from the "Medico-Actuarial Mortality Investigation" (vol. iv., Part 1, 1914) support my contention:—

	Actual deaths.		Expected deaths.		Ratio.*
Class 1.—Syphilis Certain, Thoroughly Treated; 2 years' Continuous Treatment and 1 year's Freedom from Symptoms.					
Certain syphilis between 3 and 5 years prior to application	13	...	9·32	...	139%
Between 5 and 10 years	34	...	19·56	...	174%
More than 10 years	53	...	24·42	...	217%
Class 2.—Not Thoroughly Treated or no Details Given.					
Certain syphilis between 2 and 5 years prior to application	44	...	15·52	...	284%
Between 5 and 10 years	54	...	25·52	...	212%
More than 10 years	76	...	59·09	...	129%
Class 3.—Doubtful Syphilis.					
More than 2 years prior to application	67	...	48·71	...	138%

* Being the ratio of actual and expected deaths.

All these persons, all men, were apart from their syphilis exceptionally good lives, for in spite of their syphilis they were accepted at standard rates; yet see what bad lives they were. The death-rate from tabes and general paralysis was five times the normal, and the death-rate from non-syphilitic diseases as pneumonia was also excessive. We see the same with the figures of the Gotha Insurance Company of Germany, for among 1778 men who had undergone treatment for syphilis there were 487 actual deaths against 290 expected. I think you will agree with me that the prognosis of syphilis treated as it was till quite recently is worse than we commonly thought. These cases, however, remind us that for a long while it was taught that the outlook of tabes as regards amelioration was very gloomy. Now we know it is not so bad as this, for with a thorough course of mercurial inunctions or injections many tabetic symptoms lessen, and perhaps future investigations will show that they do better still if the mercurial treatment is preceded by salvarsan or by salvarsanised serum injected intrathecally. Since, too, we taught patients the importance of exercises the ataxia may lessen considerably.

Tuberculosis.

Everything points to the conclusion that the outlook for sufferers from tuberculosis is much better than it was. There has in this country been a steady fall in the mortality during the last 60 or 70 years, and apparently the rate of fall has not been altered by modern treatment; but, of course, it is possible that the rate might have been slower during the last few years if it had not been for treatment. All post-mortem room experience shows that healed tubercle is very common, and there is no case of phthisis so bad as to be quite hopeless. Even cases of long-continued suppuration from cavities or dilated tubes can occasionally be cured by the induction of an artificial pneumothorax, and I have a friend in whom the tuberculous process spread to the ribs causing necrosis of some, his temperature was 105° F., and yet he recovered well enough to enjoy life and look after a small farm. The most fatal variety of tubercle is tuberculous meningitis, and fortunately that is one of the rarest complications of ordinary adult phthisis, but I know of two cases of undoubted tuberculous meningitis in children which recovered.

---

[1] The Lancet, Nov. [illegible], [illegible], p. [illegible]; April [illegible], [illegible], p. [illegible].

The most important thing to observe in trying to foretell the course of a case of phthisis is the state of the gastro-intestinal tract. Anorexia, vomiting, and diarrhœa are very bad signs, especially if persistent; indeed, loss of weight from any cause is bad. The most important instrument in a case of established phthisis is not a stethoscope but a weighing machine. But very bad as is the outlook of tuberculous intestinal ulceration even that may heal, for Mr. F. J. Steward once opened the abdomen of a patient of mine in whom six cured tuberculous ulcers of the intestine were found. The signs next in importance are those of general infection: for example, a persistently rapid pulse, continued pyrexia, and frequent profuse sweats are all bad, but it is surprising what a time some of these may persist and yet return to normal. These signs of general infection are of much greater importance than pulmonary signs; very few patients die from the local disease of the lungs; those that die do so because of the intensity of the general infection. Albuminuria and profound anæmia are unfavourable, and so is a strong family predisposition.

Of associated conditions diabetes, syphilis, and pregnancy very greatly increase the gravity of the outlook. As far as my experience goes I am much impressed with the extreme seriousness of either syphilis or pregnancy occurring in a person with active phthisis. I well remember a young man with active phthisis who acquired syphilis. The rapidity with which he went downhill after this was remarkable, but I have no evidence to show whether or not healed phthisis is relighted by syphilis. On the other hand, patients with pleurisy or emphysema often do well.

Many patients are brought to us because they have coughed up a little blood. The patient usually pleads that it comes from the throat, and sometimes he looks so well and his physical signs are so healthy that the doctor comes to the same opinion, but this is always hazardous, for nearly always such blood means slight phthisis. Cases such as these often come before us for life insurance. The following results are interesting:—

	Actual deaths.	Expected deaths.	Ratio.
A. One hæmoptysis within 5 years of application	46 ...	30·41 ...	151%
B. One between 5 and 10 years prior to application	63 ...	48·16 ...	131%
C. One or more hæmoptysis, last more than 10 years prior to application	223 ...	219·6 ...	102%

Now these were all taken at normal rates, and therefore apart from the hæmoptysis were apparently exceptionally good lives, yet we see that really they were much under average lives. The deaths from tuberculosis of the lungs in Group A were five times the normal, in Group B three times, and in Group C twice. In connexion with this it is interesting to notice that an actuarial investigation was made of 3000 patients who had been in the Adirondack Sanatorium from 1885 to 1911. The mortality after the date of discharge from the sanatorium of those apparently cured was about twice the normal.

I have just mentioned that cases of phthisis accompanied by pleurisy often do well, and that I think is true; but at the same time a person who has had tubercle pleurisy cannot be considered normal, for he is liable to phthisis. Thus actuarial investigations show that the mortality of those who except for a history of pleurisy are healthy is above the normal rate, and that among those who have had pleurisy the death-rate from tuberculosis of the lungs is three times the normal.

HEART DISEASE.

It is strange that for many years several (although not all) physicians quite missed the most important factor in the prognosis of heart disease—namely, the state of the cardiac muscle—and concentrated their attention on the murmurs. The tale is told that the chaplain of one of the London hospitals had a loud murmur, and the medical staff reported that he could not live long with such a murmur. He was pensioned at his full salary and lived 40 years.

Generally speaking, the louder the murmur the better, for it means that owing to the vigour of the cardiac muscle the blood is being sent forcibly through the diseased valve. The loudest murmur I ever heard was audible to the unaided ear a yard from the foot of the bed. The patient sought relief because the noise of his murmur kept his wife awake. He was doing his work as a dock labourer. Another man with a loud murmur won a London to Brighton walking race. I knew a doctor with a loud murmur who worked and lived to be over 80. Soft murmurs indicate a feeble muscle; thus many a case of valvular disease has no murmurs on admission to the hospital, the muscle is too exhausted, but a murmur appears after the patient has rested in bed. The cases of mitral constriction with a loud crescendo murmur do well; the loudness of the murmur shows a strong auricle forcing the blood so strongly through the constricted auriculo-ventricular orifice as to compensate effectually for its narrowing. Then, too, we must remember that many of the weakest murmurs we hear are directly due to myocarditis, the weakened muscle allowing of dilatation of the auriculo-ventricular ring.

More than half the cases of heart disease are caused by acute rheumatism, the micro-organism of which either directly or through its toxin affects chiefly the synovial membranes and the heart. To reach the heart, however, the poison must be carried there by the coronary vessels, and far more of it must reach the muscle than the valves or the pericardium; indeed, considering the fewness of the vessels in the valves, it is strange that they are affected at all, and putting aside malignant endocarditis the affection of them would hardly matter were it not that they pucker and so become inefficient. It is clear that the implication of the muscle is the most important. Indeed, it is by damage to the cardiac muscle by toxins that probably most people die; hence that invaluable rule of prognosis that a rapid pulse is a bad sign. We all know that a case of suppurative peritonitis is doing badly if the pulse is mounting in rate. Whether or not the pulse is mounting often determines whether an operation on the abdomen shall or shall not be performed; a rapid pulse is of bad omen in typhoid fever, pneumonia, phthisis, exophthalmic goitre, and indeed in any condition. In life insurance work the actual deaths of those with rapid pulses are double those which would be expected with healthy lives. The importance of the muscle being so great we shall be guided in our prognosis by the signs of diseased muscle—e.g., rapidity of the pulse, force of the apex beat, force of the pulse, signs of dilatation of the heart, and in hospital work the electrocardiograph is of help.

In passing we may note that an irregular pulse is not so often of bad prognostic significance as a rapid one. Probably because its very irregularity means—as in the case of extrasystoles—long pauses during which it can recover itself. Nevertheless, irregularity is of some considerable importance, for Cowan tells us that out of 102 cases of mitral disease 31·4 per cent. died, but the deaths among those with regular rhythm were 20·5 per cent., with irregular 58·6 per cent. Among 58 cases of aortic disease 29·3 per cent. died; 25·6 per cent. of them had regular rhythm and 40 per cent. irregular. Of all irregularities that due to extrasystoles is by far the least important.

When a patient is lying in bed with recent rheumatic carditis we must keep him in bed, it may be weeks, so long as there is any clinical evidence that the affected muscle is undergoing repair, but if the murmur is valvular we do not need to keep him in bed till it has disappeared; indeed, we might keep him till his death if we were to wait for that. Nothing shows the skill of a doctor more than his management of heart cases. If he keeps them in bed too long he does irreparable harm, for the muscle gets feeble and flabby; if he keeps them in too short a time the prognosis is made bad because the raised blood pressure that follows exertion leads to dilatation of the heart if the muscle is weakened by unhealed carditis. When such a case gets up the ultimate prognosis will depend entirely upon the judgment with which we allow a little exercise so as to strengthen the heart, but not so much as to dilate it; for the first few weeks the doctor must frequently see his patient, increasing or decreasing the exercise day by day. All this can generally be done at home; if so, there is no need for places which lay themselves out for cardiac patients. We cannot leave the prognosis of heart disease without reminding you of the remarkable fact that rheumatic nodules are always associated with severe cardiac disease; we now know this because there are always similar nodules in the muscle substance of the heart.

PNEUMONIA.

Let us take another common disease—viz., lobar pneumonia—to illustrate some points in prognosis. A most important circumstance is the age. I took at random from my case-book 12 cases. Six were over 60; of these, 5 died without any complication. Six were young. The first was a girl, aged 15, who had such severe mania that Sir *George Savage* and I both thought she would die; she got perfectly well. The second, a lad with such severe pericarditis that his temperature was up for three weeks, got well. The third, a girl aged 15, who coughed up pus from an empyema following the pneumonia, got quite well; the fourth, a girl so ill that she was comatose, with a temperature of 105° F., got well; the fifth, a male aged 25, got double empyema after his pneumonia, but made a complete recovery; and the sixth, a young man with respirations of 108, got quite well. Probably the next most important fact in the prognosis of pneumonia is whether the patient is alcoholic; those who have drunk heavily rarely recover. It is important to remember that it is not often the amount of lung that is involved that kills in pneumonia, as is shown by the fact that it is comparatively rare to see a patient with pneumonia dying livid, but pneumonia is chiefly fatal by the action of the toxin on the heart; a very rapid feeble pulse of poor volume is always very serious.

Much can be learnt about the prognosis in pneumonia from the temperature chart. A high temperature—provided it is not so high, e.g. over 105°, as to be in itself dangerous—is a good sign. On the other hand, a low temperature—namely, under 100°—is a bad sign, for it means that the patient is not reacting to the stimulation of the invasion by the pneumococcus. In the same way a striking leucocytosis indicating a good reaction is favourable—for example, in consecutive cases that got well the counts were 30,000, 27,000, 40,000, 28,000, 24,000.

As with so many diseases, so with pneumonia, the time at which the patient has the disease is important; thus, in some years the mortality is high, in others low. In 1895, when post-influenzal pneumonia was very rife, in some institutions the mortality shot up to the appalling figure of 64 per cent. If sufferers from pneumonia sleep badly they do badly as a rule, and if they sweat much apart from the crisis they do badly, probably because the sweating indicates severe infection.

NEPHRITIS.

Turning now to the prognosis of nephritis. One of the most serious facts is the presence in the degenerative variety of albuminuric retinitis. Sufferers from chronic renal disease in whom this is present probably never recover. In one set of cases 85 per cent. of them were dead within the first year after the discovery of the degenerative retinitis, and 9 per cent. more died in the second year. On the other hand, inflammatory retinitis, best shown by optic neuritis, may be associated with acute nephritis, which gets well.

An important circumstance in the prognosis of chronic interstitial nephritis is the age of the patient. Young subjects with chronic granular kidney rarely if ever do well, and almost anyone under 30 who has it will soon die. Probably the cases in the first half of life are a different disease from the cases in middle life, for while people with interstitial nephritis in later middle life may die from cerebral hæmorrhage or pneumonia or various conditions which are associated with granular kidney, those in the first half of life who have granular kidney almost invariably die soon of uræmia.

The sufferer from this disease who complains of general weakness does badly, so does the patient who is thin and pale, and if a patient takes to bed because of weakness he probably will not live long. Skin troubles, too, increase the seriousness of the outlook; the rare general dermatitis of Bright's disease usually kills, and very œdematous parts are liable to erythema or more severe inflammatory changes in the skin, and these are frequently fatal. Severe long-continued diarrhœa in Bright's disease, inasmuch as it points to some colitis or entero-colitis, is of very dangerous prognosis. To estimate the outlook when the patient is definitely uræmic is very difficult, but, speaking generally, the more severe the symptoms of uræmia the worse the prognosis. When the patient has a cerebral hæmorrhage the outlook is by no means necessarily fatal. The public have a saying that the third stroke is fatal. The following point to a fatal result: (*a*) Coma still present at the end of 24 hours; (*b*) Cheyne-Stokes breathing as a result of the hæmorrhage; (*c*) much mucus in the lungs; (*d*) paralysis of all four limbs; (*e*) a very low temperature; and (*f*) a very high temperature.

Pneumonia, pleurisy, peritonitis, and pericarditis all greatly increase the gravity of the outlook. Suppression of urine is of most serious importance. The actual amount of albumin is not of much value in prognosis, but an increase in the amount is of bad augury, a lessening is of good. The normal amount of urea in the blood is 0·3 per cent.; anything over 1·0 per cent. shows that uræmia is likely, in which condition we may get a reading as high as 3 per cent.

DIABETES.

Diabetes is a disease of great interest from many points of view, and not least from that of prognosis. In the first place it is a racial disease, being terribly common among the natives of India, and at the present time the frequency of death from diabetes in the East is so serious that the Government have sent out a member of our profession to investigate the subject. Then, too, we have the well-known fact that it is commoner in Jews than Christians.

Quite apart from race, however, it is a family disease. Thus Otto May, investigating 76,333 deaths at the Prudential Assurance Company, found 1143 were from diabetes. The family histories of these showed a death from diabetes in 41—i.e., 3·6 per cent. A control investigation of 1143 other cases picked out at random from the same period gave a family history of diabetes in only 12—i.e., 1·05 per cent. A further study of his figures shows that diabetes includes at least two different groups of cases: (1) a group in which the incidence is in middle or late life, the disease comparatively mild, and the family factor absent; and (2) a group characterised by earlier incidence, more rapid termination, and a tendency to run in particular families. This affects our discussion of prognosis, for if there be a strong family history the sufferer from diabetes will probably die rapidly and before he attains middle life. Further, it appears that the hereditary factor comes out more in the male—that the death from diabetes of a father or brother is more ominous than that of a mother or sister, and that the male is more liable to suffer from family diabetes than the female. The distinction that these investigations show as to two kinds of glycosuria according to age are well known. I often wonder if the passage of a little sugar by an elderly person matters. We all know the elderly persons, men especially, whose sugar is easily controlled by diet; usually they pass no diacetic acid and have few of the symptoms of diabetes. Indeed, it is highly probable that a number of elderly men have a little glycosuria, but they go to their grave without its ever having been suspected and as far as we know without its ever having done them any harm.

I would suggest that the most important thing about the prognosis of diabetes is the effect of treatment; it is impossible to know beforehand whether a patient is going to respond easily to this. The other important thing is whether the sufferer is able to live in easy and comfortable circumstances. No doubt if diabetics are well off the ease with which they can buy suitable food is greatly in their favour, but of almost equal importance is the fact that they can give up their work and lead a quiet life. Worry is a powerful factor in precipitating diabetic coma. I know middle-aged persons who have had diabetes for 20 years and whose urine always contains some sugar and often a little diacetic acid, but then they have always been very careful to carry out the treatment ordered and to live quietly. A member of our own profession always gets considerable glycosuria when working hard, but when he takes a long holiday it always diminishes considerably and often disappears altogether.

Those who are occasionally a little drowsy must always be on their guard, but if large doses of bicarbonate of soda are given the drowsiness may entirely pass away; but, on the other hand, I doubt if persons ever recover from real coma, although alkalies may prolong life a little. Lately Dr. E. P. Poulton and others have shown that during the dyspnœa which so often precedes, and always accompanies, diabetic coma there is a considerable diminution in the CO_2 in the alveolar air. The explanation is that the blood being more acid than normal in those who are going to have diabetic coma, the increased acidity exciting the respiratory centre leads to deeper respiration and consequent washing out of CO_2 from the alveolar air, and an apparatus has been devised for easily measuring the CO_2 in the alveolar air. I have a strong suspicion that if lipæmia is very marked the outlook is bad. I need hardly remind you that gangrene, phthisis, and almost any severe illness increase the gravity of the outlook in diabetes, but it is of interest to remember that pyrexia sometimes increases the sugar and sometimes leads to its disappearance, and operations have the same variable result.

SOME GENERAL FACTORS IN PROGNOSIS.

There is another aspect of the prognosis question and it is this: that we cannot possibly tell whether a treatment is good or bad unless we know what is the natural course of the disease. Over and over again good results are ascribed to treatment quite unjustly; the patient has got well because in the natural course of the disease he would do so, treatment has had nothing to do with it. [The lecturer here gave results already published of the natural course of the disease in those who suffer from gall-stones and those who suffer from exophthalmic goitre.]

In trying to estimate the prognosis in any disease we have not only to think of the natural course of the disease but the kind of patient who is afflicted by it. Time will only permit us to take three instances of this. One circumstance that makes a patient a bad life is excessive weight. The actuarial research to which I have already referred has constructed a table:—

	Ratio of actual to expected deaths.
Average normal weight	93 per cent.
From 5 to 15 per cent. overweight	114 ,,
,, 15 ,, 25 ,, ,, ...	129 ,,
,, 25 ,, 35 ,, ,, ...	136 ,,
,, 35 ,, 50 ,, ,, ...	165 ,,
More than 50 ,, ,, ...	223 ,,

Further, a study of the figures clearly shows that the mortality increases in proportion as the abdominal girth over that of the expanded chest increases; thus the expectation of life of a man who is 50 per cent. overweight and whose abdominal girth exceeds that of the chest by more than 3 inches is very bad. Among heavy people the death-rate from diabetes, apoplexy, heart disease, pneumonia, and Bright's disease was very high, while from tuberculosis it was very much lower than normal, and generally speaking the greater the weight the lower the mortality from phthisis. It must be remembered that the figures just given understate the case, for all the people from whom the figures are drawn were taken at standard rates, and as they were heavy a rigid selection was made so that only those which appeared exceptionally healthy were insured.

It is well known that over-indulgence in alcohol greatly damages prognosis in any disease. The following ratio shows that alcoholic subjects are bad lives, as when there was one alcoholic excess or more, the last within two years of application, the ratio of actual to expected deaths was 174 per cent. Here again the case is understated, for these figures refer to lives apparently so exceptionally good that they were taken at ordinary rates in spite of the history of alcoholic excess.

Lastly, there is the mental factor. Every doctor dislikes the patient with an acute illness who is sure he will die, and likes the patient who is certain he will recover. A boy said he knew he would die as a result of an anæsthetic necessary for an operation, and he did before the operation was begun, although the anæsthetic was given by a highly skilled anæsthetist.

INCOMPLETE ROTATION OF THE INTESTINAL LOOP AS A CAUSE OF RETROCOLIC HERNIA.

WITH NOTES ON THE DEVELOPMENT OF THIS CONDITION.

By A. G. TIMBRELL FISHER, M.B., CH.B. BRISTOL,
M.R.C.S. ENG., L.R.C.P. LOND.,
DEMONSTRATOR OF ANATOMY AND OF SURGICAL APPLIED ANATOMY,
UNIVERSITY OF BRISTOL.

HERNIA other than that of the vermiform appendix into a retrocolic fossa is a rare condition. An analysis of the cases hitherto described is given by Moynihan,[1] according to whom many of the cases hitherto recorded cannot be regarded as authentic. He passes in review some 14 cases, and decides that but 7 of these are genuine. The interesting case described by Fürst (*vide infra*) is relegated to the doubtful category; however, it seems not improbable that it is in reality one of retrocolic hernia due to a developmental anomaly, as in some of its features it resembles the case I describe later. For a more complete understanding of this interesting form of retrocolic hernia it will be necessary first to review our knowledge of the anatomy and development of the retrocolic fossæ.

Anatomy of the retrocolic pouches of peritoneum.—The retrocolic fossæ vary considerably. Often they are both absent, and in the majority of cases only one is present. Berry[2] gives the following statistics: (1) Internal fossa alone, 15 per cent.; (2) both fossæ, 10 per cent.; and (3) external fossa alone, 5 per cent. The same authority places the and internal retrocolic fossæ. The internal retrocolic fossa is best described by Lockwood and Rolleston[4] as follows: "It is bounded on the right by the mesentery of the ascending colon and on the left by the enteric mesentery. It is situated behind the angle of junction of ileum and cæcum, which have both to be lifted up to see its mouth. The fossa itself runs a varying distance upwards behind the ileo-colic junction and parallel to the ascending colon." It must be borne in mind, to avoid confusion, that they gave the term "ileo-cæcal" to the fossa under consideration—a term which is now more usually applied to the fossa between the meso-appendix and the ileo-cæcal fold. In another place (*loc. cit.*) Lockwood states that "the fossa may reach half-way up the ascending colon beyond the crest of the ilium and end close to the kidney and duodenum."

The external retrocolic fossa, first described by Treitz, separates the layers of the mesocolon, and its mouth is usually at the junction of cæcum and colon, and looks forwards and downwards. It is usually quite small, but occasionally may be as large as a finger. A retrocolic hernia due to a developmental anomaly is usually into a modification of this fossa.

Richard Berry confirms Jonnesco's work on the fossæ, and states: "When both fossæ are present three peritoneal folds are required for their formation; these are from without inwards: 1. External parietocolic fold or outer layer of the ascending mesocolon. 2. Internal parietocolic fold or inner layer of ascending mesocolon. 3. Mesenterico-parietal fold or abdominal attachment of the enteric mesentery internal to the mesocolon."

Comparative anatomy of the retrocolic fossæ.—The process of secondary adhesion of the ascending colon to the posterior abdominal wall, to be shortly described, is an adaptation to the upright position, and the retrocolic fossæ are therefore only found in orthograde primates.

Development of the retrocolic fossæ.—With regard to this there are two principal theories—viz., that they are either (*a*) primary or (*b*) secondary in origin. (*a*) The primary origin. Treitz, Gruber, and Lockwood held that during the descent of the testis the gubernaculum exerted its influence upon the cæcum as well, causing its descent into the right iliac fossa, and that this descent by dragging upon the peritoneum caused the formation of the folds bounding the fossæ. Waldeyer held that the cæcum continues to descend after the ascending colon has become fixed, and thus raises up the peritoneum in the form of two folds which bound the retrocolic fossæ. (*b*) The secondary origin. The theory of secondary formation of Toldt states that the retrocolic fossæ are due to a some time, which led to a diagnosis of chronic appendicitis. In the case recorded by Mansell Moullin there was a history of four previous attacks similar to the one that led to operation. Diagnosis is rarely possible, although in a case of Rieux a swelling was present on the inner side of the cæcum, which was smooth and rounded and was tympanitic on percussion, and which led to a correct diagnosis.

Case of Aschoff. A coil of intestine was found in a pouch behind the cæcum and ascending colon. The ascending colon had a very long mesentery.

Case of Mansell Moullin. On passing a finger down towards the cæcum a ring was felt around some intestine. It passed inwards towards the middle line and slightly downwards. At post-mortem examination a loop of ileum was found lying in a sac behind the cæcum, communicating with the general peritoneal cavity by an opening a little more than an inch in diameter.

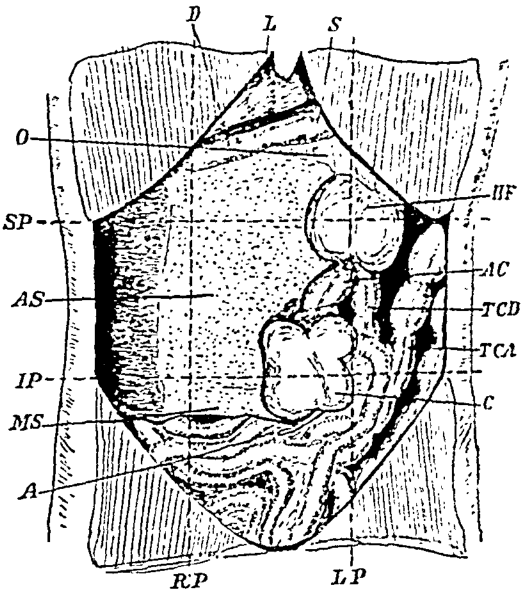
Case of Neumann. A loop of small intestine 10 cm. in length was found to be strangled in the retrocolic fossa. On lifting up the cæcum a rounded opening with sharp-edged margin was seen which would admit two fingers. This led to a peritoneal pouch extending upwards behind the ascending colon.

Case of Funkenstein. At post-mortem examination an opening was found behind the cæcum with rounded, firm edges 2 cm. in diameter. Through this the finger could be passed into a sac running up behind the cæcum and ascending colon as far as the upper margin of the ilium.

Case of Atherton. Post-mortem examination showed that the cæcum was distended and the lower two feet of ilium collapsed; at this point resection had been made. There was a pouch one inch deep with an opening of the same diameter situated to the outer side of the lower end of the cæcum and partly behind it.

Case of Fürst. This deserves a little more attention, as it has been the subject of a great deal of controversy. Fürst himself considered it a case of retrocolic hernia due to a developmental abnormality. There can be little doubt, having regard to its similarity to the case to be presently described, that he was correct. The case recorded by Fürst came to light in the body of a man aged 61, in the dissecting room. A large peritoneal sac was present occupying the right hypochondriac, right lumbar, and part of the umbilical regions. The cæcum was below the umbilicus, and it and the ascending colon were both on the inner wall of the sac. The rest of the large intestine was pushed well over into the left side of the abdomen. The sac contained two-thirds of the small intestine, the entering coil of which was jejunum just beyond the duodeno-jejunal flexure. Brösike considered that the case was one of hernia into the parajejunal fossa which is present when the jejunum is fixed in the peculiar manner described by him, and that the hernia had developed in an abnormal manner owing to a free common mesentery to the cæcum and ascending colon and to migration of the mouth of the sac. It is unfortunate that Fürst gives no full account of the duodenum and commencement of jejunum. Nevertheless, it is in all probability a case of retrocolic hernia due to incomplete rotation of the U-shaped loop of intestine.

Author's case.—This came to notice in the dissecting-room. The subject was a man, aged 75, whose death was due to senile degeneration of the heart. On opening the abdomen (see diagram) a broad, apron-like fold was seen stretching across the greater part of the right side of the abdomen. Further examination showed that the fold of peritoneum was the anterior wall of a hernial sac, and had the following boundaries. On the left side it was attached to the "hepatic" flexure of the colon, ascending colon, and cæcum. Superiorly it was attached to the lower border of the first part of the duodenum and became adherent to the right edge of the great omentum. On the right side it bulged somewhat and became continuous with the peritoneum over the right kidney and iliac fossa. Inferiorly it presented a free edge which was by no means tense, and it was devoid of any vessel. The lower free edge ran in the interspinous plane and was attached laterally to the peritoneum over the right psoas muscle, and internally to the posterior surface of the appendix and meso-appendix. The anterior wall of the sac occupied the following regions (see diagram): Lower half of epigastric



Sketch of appearance on opening abdomen. D, Duodenum (first part). L, Liver. S, Stomach. O, Great omentum. SP, Subcostal plane. AS, Anterior wall of sac. IP, Intertubercular plane. MS, Mouth of sac. TCA, Transverse colon, ascending limb. C, Cæcum.

region in its right two-thirds, right two-thirds of umbilical region, the right lumbar and hypochondriac regions, and the upper third of the right iliac and hypogastric regions.

The large intestine.—(*a*) Cæcum. The position of this was most unusual. The whole viscus was rotated and kinked, so that the posterior surface looked directly forwards and the anterior surface was in contact with and partly hid from view the ascending colon. The lower border of the cæcum thus was only separated from the hepatic flexure of the colon by a very short distance. The anterior surface of the cæcum was also in very close proximity to the middle of the transverse colon (*q.v.*) and bound down to it by a prominent peritoneal adhesion. The upper two-thirds of the cæcum occupied the lower and left quadrant of the umbilical region; the lower third occupied the upper left quadrant of the hypogastric region (see diagram).

(*b*) Appendix. Occupied the upper left quadrant of hypogastric region; pointed downwards and backwards, but chiefly inwards, so that the tip exactly reached the mesial plane a third of the distance between the symphysis pubis and intertubercular plane. Length 3 cm. Meso-appendix reached the tip and was thick and fatty.

(*c*) Ascending colon. Commenced at the points of intersection of the central plane and the intertubercular plane, and ran upwards and to the left to the hepatic flexure. Length 2·2 inches; it was adherent to the post-abdominal wall, and had attached to its right side the above-mentioned fold.

(*d*) Hepatic flexure. The intersection of the left lateral vertical and subcostal planes occurred in the centre of this, which therefore occupied the adjacent parts of the following regions—epigastric, left hypochondriac, umbilical, and left lumbar zones.

(*e*) Transverse colon consisted of two limbs, a descending and an ascending. The descending ran from the hepatic flexure following the left lateral plane as far as the brim of the pelvis; the ascending limb passing upwards and outwards in the left iliac and lumbar regions to splenic flexure. The kink in the transverse colon lay over the brim of the pelvis and was connected to the anterior surface of the cæcum in the aforementioned way. The mesentery of the transverse colon was not connected with the posterior layers of the great omentum, but was connected by somewhat loose adhesion to the mesenteries of the descending and iliac colon.

(f) Descending and iliac colon. Each pursued a fairly normal course, but there was a mesentery common to both attached near the middle line to the posterior wall of the abdomen.

(g) The great omentum had the usual attachments but was pushed over into the left side of the abdomen and ended in a long pointed process.

(h) Liver and stomach were normal in their position.

Appearances on opening the sac.—On opening the sac it was seen to extend upwards beneath the right lobe of the liver, and it was seen at once that the condition was due to a developmental abnormality. On the floor of the sac could be seen the root of the mesentery, which was attached along an oblique line stretching from the junction of the first and second parts of the duodenum downwards and to the left to the termination of the ileum. Its length was about 6 inches. Some 5 feet of small intestine, presenting a perfectly normal appearance, were also found in the sac. The second part of the duodenum, which was also in the floor of the sac, had a continuation of the mesentery attached to its left side, but was adherent behind to the posterior abdominal wall in a fairly normal way. The third part of the duodenum was freely movable, having a common mesentery with small intestine from which it was indistinguishable. It was not crossed by the superior mesenteric artery, neither was there any trace of a duodeno-jejunal flexure. The whole length of the small intestine was only 9½ feet.

Developmental considerations.—At an early stage of development the intestine is a straight tube of nearly uniform calibre attached to the posterior abdominal wall by a continuous mesentery. The growth of the liver and intestine causes the mid-gut—i.e., that portion between the entrance of the common bile-duct into the duodenum and the splenic flexure—to form a U-shaped loop, which is forced through the widely open umbilicus into the umbilical cœlom. To the convexity of the loop is attached the vitelline stalk, which may persist as a Meckel's diverticulum. The mesentery of the loop is continuous anteriorly with the dorsal mesogastrium and posteriorly with the hind-gut mesentery. Running in the loop mesentery is the superior mesenteric artery, which divides the mesentery into a pre-arterial and a post-arterial part. This condition may be seen at the fifth week. The pre-arterial part of the mesentery is destined to form the greater part of the mesentery of the small intestine; the post-arterial part forms the mesentery of the ascending and transverse colon and the lower part of the mesentery proper. At the

so that the superior mesenteric artery comes to lie in front of the third stage of the duodenum. The continued growth of the small intestine presses the descending and iliac colon with their mesenteries against the peritoneum of the posterior abdominal wall, and secondary adhesion takes place between them, so that normally these parts of the large intestine have no mesentery.

Application of these facts to the case under consideration.—In all probability rotation of the U-shaped loop ceased at the point where the distal limb lay in front of the proximal limb. Secondary adhesion of the distal limb—the future ascending colon—to the peritoneum of the posterior abdominal wall occurred early and imprisoned the proximal limb of the loop from which the greater part of the small intestine is formed. Thus the cæcum was *prevented from swinging upwards and to the right* to its position beneath the liver. The small intestine developed towards the right chiefly, and in its growth pushed the large intestine to the left side of the abdomen. The peritoneum connecting the right part of the posterior surface of the ascending colon to the posterior abdominal wall (right layer of ascending mesocolon or right parietocolic fold) became greatly stretched and formed the anterior wall of the sac. The abnormal position in which the small intestine developed accounts for its extreme shortness and also explains why the descending and iliac colon have both a mesentery. The form of the duodenum, the presence of its mesentery, the absence of the duodeno-jejunal flexure, and the position of the superior mesenteric artery all show that rotation stopped at the abovementioned stage. The conclusion is, therefore, that this form of hernia is due to an abnormality of development occurring at a very early stage.

My thanks are due to Professor Edward Fawcett for kind suggestions during the preparation of this article.

HÆMORRHAGIC TYPHOID FEVER.

BY ADRIAN CADDY, M.D., B.S. LOND., F.R.C.S. ENG.;
AND
BARRÉ MOLONY, M.B., CH.B. EDIN., F.R.C.S. EDIN.

DURING the past two years we have had under our care three interesting cases of typhoid fever, two of the cases developing very unusual symptoms. In the first case during the course of the fever there developed an extensive purpuric eruption, which was followed by a generalised bleeding from the mucous membranes—viz., the tongue, fever continued high, varying from 102° to 104°, but otherwise there was no point of special interest. The quinine was discontinued after he had taken 30 grains daily for a week, as it had not had any influence on the fever. This course of quinine excluded the possibility of any malarial infection. The blood was now tested by the health department of the corporation, and Widal's reaction for typhoid fever proved positive. On Oct. 5th some bleeding from his gums was noticed. On the 6th a purpuric eruption started on his legs and gradually spread all over his body, the spots remaining discrete and varying in size from a pin's head to that of a pea. The spots kept on coming out until his death. On the 7th a hæmorrhage occurred into his bladder. This bleeding was so severe that clots formed and the bladder was washed out to get rid of them. On the 9th there was a big hæmorrhage from the bowel. A small pin-point on the dorsum of the tongue started oozing freely. On the 10th there were further hæmorrhages from the gums and intestines, and he gradually sank and died the next day.

CASE 2.—*The patient, aged 30, a European overseer employed in a jute mill eight miles from Calcutta*, was admitted by us into a nursing home with the following history. He had been suffering from fever since Sept. 16th, 1912, but continued his work until the 22nd, the day he saw us. In the nursing home the fever continued, varying from 101° to 103° F., and was uninfluenced by quinine in quantities of 30 grains daily continued for a week. The blood was tested and Widal's reaction for typhoid fever found positive. The temperature touched normal on Oct. 7th, the pulse having varied from 70 to 90 during this period. The temperature remained intermittent for a few days, and then commenced rising again, reaching 104° on the evening of the 11th. Quinine was again started in doses of 20 grains daily without effect. On the 14th the temperature dropped to 100°, and the pulse rose to 120 per minute; this was followed by his bringing up a large amount of blood. It was a little uncertain whether it was vomited or coughed up. *On the 15th he brought up more bright red blood; this time there was no doubt that he vomited it*; also he passed bright red blood by the bowel. This vomiting and passing of blood continued during the next two days, the temperature varying from 100° to 104°. He died on the 18th, after another large hæmorrhage from the bowels.

CASE 3.—The patient, a European aged 24, an employee in a jute mill, was admitted into a nursing home under our care on March 30th, 1914, with a history of having suffered from fever for six days. When we saw him his temperature was 104° F. During the next two weeks it varied from 101° to 103·5°. We gave him quinine in quantities of 30 grains daily for five days, and then stopped it, as the temperature was going up and the quinine seemed to be causing diarrhœa. On the twelfth day of the fever Widal's reaction for typhoid fever was positive. His fever continued steadily with some diarrhœa for 22 days. The temperature then shot up to 105·6°. Sponging rapidly brought this down to 102°. In the course of a few hours his temperature fell to normal, and this was followed by a hæmorrhage from the bowel. *These bowel hæmorrhages occurred on five occasions* during the next four days and his condition became very serious. Then he gradually took a turn for the better. The temperature in the course of ten days came to normal. The diarrhœa ceased, the bowels became constipated and had to be relieved by enema. His temperature has now (June 10th) been normal for three and a half weeks; he is sailing for Japan in a day or so for a sea voyage to complete his recovery.

Remarks by DR. CADDY.—It will be noted that in each case the patient was forthwith put on to a course of quinine. Although malaria is uncommon in Calcutta, still two of the cases developed their fever at the period of the greatest incidence of malaria in the year—viz., September. None of the cases actually resided in the city of Calcutta, two of them living eight miles outside, and one coming from Dacca, over 100 miles away, where malaria is much more prevalent.

It is very *uncommon for Europeans* living in the English quarter of Calcutta to get infected by malaria. Europeans who perform all their service in Calcutta without ever living in other parts of India generally escape malarial infection. One might say that all cases of fever coming from the country districts are put on a course of quinine forthwith. *It is uncommon* to find malarial parasites in *Europeans; so habitually* do they dose themselves with quinine for slight colds and chills, that the parasites are driven out of the peripheral circulation. The quinine is given in doses of 30 grains daily in solution for five days. If the temperature has not fallen to normal in that time, one may exclude the probability of malarial infection. The dose of quinine required to reduce a malarial temperature to normal was worked out some seven years ago at the General Hospital, Calcutta. It was found that if only 20 grains daily were given to an uncomplicated case of malaria the fever took a week to abate. If, however, 30 or 40 grains were given daily the temperature came down to normal in four days. A still further increase in the dose to 60 grains daily did not shorten the period any further, and in addition was in the danger zone of quinine blindness.

This quinine treatment in cases which eventually prove to be typhoid often seems to me to aggravate the disease. The headache is made worse, the stomach is often irritated, and diarrhœa is brought on. But one is on the horns of a dilemma. If suspicions are correct and the case turns out to be typhoid all is well. On the other hand, one must bear in mind that the common malarial infection is malignant tertian. I once saw an English army officer die through omission to give quinine. The patient had fever; the blood was examined by his medical attendant and no parasites found. Three days latter he became comatose; parasites were then found in large numbers in his blood by another medical man. In spite of quinine solution being given intravenously he died.

As regards purpura complicating typhoid and hæmorrhagic typhoid fever we have been able to find very few references in current literature. Sir Thomas Barlow[1] has described a case of typhoid fever with extensive purpura, some of the mucous membranes being affected. The patient passed into a state of coma lasting 48 hours, but subsequently recovered. She died later from a relapse of the fever, and there was found a large hæmorrhage in the subarachnoid space, also hæmorrhages into the mediastinum and retroperitoneal tissues. The best description of a case of hæmorrhagic typhoid fever is given by Goodall.[2] His case is very similar to our own. His article contains several references to the current literature on the subject. In his own experience of 1733 cases in 11 years at the Eastern Fever Hospital, Homerton, he only saw one marked case. In 14 other cases hæmorrhage other than intestinal had occurred, affecting the fauces, nose, pleura, lungs, conjunctiva, mesentery, and uterus. All but 3 of the 15 cases died. Hence he thinks that a purpuric or petechial eruption is of grave import in typhoid fever.

In THE LANCET[3] is quoted a paper by Pissary and Gauchery, of Paris, describing a case of typhoid fever complicated by acute hæmorrhagic nephritis. These authors found records of five similar cases in the "Thèses de Paris." McCrae[4] in a series of 1500 cases at the Johns Hopkins Hospital had only

[3] THE LANCET, 1911, vol. i., p. [illegible]
[4] McCrae: Osler and McCrae, System of Medicine.

3 cases of hæmorrhagic typhoid fever—that is to say, cases in which bleeding occurred from various parts of the body. In this same series purpuric spots were noted in 38 cases. In the majority of these rose spots first appeared which later became hæmorrhagic. In 9 of these cases the rash was regarded as hæmorrhagic, 3 of them being the hæmorrhagic type noted before.

Remarks by DR. MOLONY.—In discussing the question of treatment (other than dieting and nursing) of these cases one must think of them as examples of two different types of hæmorrhage as it occurs in the course of typhoid fever—viz., (1) due to widespread damage to vessels in *different* parts of the body; and (2) due to gross damage by ulceration to one or more vessels in the gut. Case 1 is an example of the first type; Cases 2 and 3 are examples of the second type. The aims of treatment (we are not discussing prevention) are, first to stop the bleeding, and secondly to make up for the loss of body fluids.

To stop the bleeding the first essential is to rest the bleeding part. This, as in the third case, may be obtained by administering opium, in the form of pil. plumbi c. opio, 4 grains every three hours. The coagulability of the blood may be increased by giving calcium salts. A patient on three pints of milk per diem has a daily intake of about 100 grains of calcium salts, chiefly in the form of phosphate, in the 24 hours—an amount sufficient, one would think, for his needs. In the second case the hæmorrhages were so sudden and profuse and came from so high up the intestinal tract, possibly from the stomach, that drug treatment was unlikely to be successful. In all future cases one would certainly use emetine hydrochloride as advocated by Low,[3] who reports success from its use in cases of bleeding from cancer of the rectum and from gastric ulcer. In the first case a different line of attack is obviously necessary, but the attack is even more of a forlorn hope than in the other type of case. There seems as little hope of checking the bleeding in this type of case as there is in stopping the hæmorrhage in the last stages of acute lymphatic leukæmia, a condition which Case 1 resembles. One might try normal horse serum, but there is little hope of success.

To make up for loss of body fluids it seems logical that one should transfuse these cases of the second type, and hypertonic saline, as likely to help in increasing the coagulability of the blood, would be the fluid of choice. Against transfusion it may be said that Case 3 made a rapid and complete recovery without it. One doubts very much whether any transfusion could have saved Case 2, so rapid and profuse was the hæmorrhage. As for transfusion in Case 1, the bleeding here seems rather the expression of a profound toxæmia and was merely a contributory cause to the fatal issue, whereas in the other cases the actual loss of body fluid was the chief feature to be combated. In the third case it is interesting to note that a dose of antityphoid vaccine was given the day before the fever started. It is difficult to say whether this influenced the result one way or another.

Calcutta.

SOUTH-WEST LONDON MEDICAL SOCIETY.—The [illegible] annual dinner of this society will take place at the [illegible] Hotel, [illegible], on Wednesday, Oct. 7th, at [illegible] P.M. The honorary secretary is Mr. R[illegible] F. [illegible], 28, Westside, Wandsworth Common, S.W.

ORAL SEPSIS IN THE DIAGNOSIS AND TREATMENT OF PULMONARY TUBERCULOSIS.

BY R. C. WINGFIELD, B.A., M.B. OXON., M.R.C.P. LOND.,
MEDICAL OFFICER IN CHARGE OF THE TUBERCULOSIS DEPARTMENT, ST. THOMAS'S HOSPITAL.

THE results of the first year's coöperation between the dental and tuberculosis departments at St. Thomas's Hospital have been sufficiently encouraging to make me think them worth recording. Every tuberculosis officer knows the trouble of the doubtful case with its suspicious but indefinite history of loss of weight, occasional irregular pyrexia, cough, and expectoration of muco-purulent sputum, repeated examinations of which fail to demonstrate the presence of tubercle bacilli. The physical signs in the chest, as also the X ray findings, may be suggestive, but at the same time not conclusive of pulmonary tuberculosis, while the complement-fixation test and experimental inoculation of the patient's sputum require some time for their completion; meanwhile the patient, in spite of general tonic and hygienic treatment, may show no signs of improvement, and the original problem, "Is this or is this not a case of early pulmonary tuberculosis?" remains unsolved. Further, one may have the uncomfortable feeling that the time and money of the tuberculosis department are being spent upon patients who are in reality non-tuberculous. It is true the facilities afforded by observation beds often assist the officer in arriving at a proper diagnosis by more careful clinical observation or by the employment of diagnostic injections, but it must be remembered that not only are the doubtful cases too numerous for the application of these procedures, but also many dispensaries are not equipped with observation beds at all. Early diagnosis is important if the disease is to be cured or arrested, but at present no specific method has been discovered whereby the early diagnosis can be made with certainty.

I have found, and I expect many have made a similar discovery, that the routine examination and treatment by an experienced dental surgeon of the mouth of all dispensary patients is not only of value in the treatment of chronic pulmonary tuberculosis, but is also of considerable use in eliminating numbers of doubtful cases. A clean mouth is the exception among the poor, although many of this class, it is true, enjoy good health in spite of the constant septic absorption thereby entailed. But once infection by a chronic debilitating disease such as tuberculosis has occurred, oral sepsis undoubtedly plays a large part in dealing with, and perhaps altogether preventing the acquisition of, that high degree of resistance by which alone a cure can be effected. Chronic cases with a tendency to relapse who have had full sanatorium treatment require the greatest care and the best environmental conditions if the working capacity, which after all is of essential importance, is to be maintained: untreated oral sepsis under these conditions may frequently turn the balance adversely for the patient.

The number of cases dealt with during the year in the tuberculosis department of St. Thomas's Hospital is hardly large enough to allow of definite conclusions being drawn as to the efficacy of the radical treatment of oral sepsis in chronic pulmonary tuberculosis, but it is sufficient to give an indication which may be worth while following up.

It will be noticed that out of the 41 cases collected 21, or roughly 50 per cent., were diagnosed as ? pulmonary tuberculosis—that is to say, they were sent to the dispensary as tuberculous patients, and though the diagnosis could not be definitely proved it is probable that in some of the cases at any rate it was correct. This being so, seeing that all these patients had severe degrees of oral sepsis, the supposition arises that oral sepsis may play an important part in determining the reaction to infection by the tubercle bacillus. For in an overwhelming majority of cases a man with a clean mouth must be in a better state of health than a man with a dirty one, and perfect health is our greatest asset when we have to deal with tuberculous infection.

The coöperation between the two departments mentioned above is not so easy in actual practice as it sounds. The first difficulty is to get the patient to see the dentist at all. This can best be got over by arranging for the dental surgeon to examine the patients in the dispensary at the time of their ordinary attendance to receive medical treatment. If this is not done it is generally found that nothing short of raging toothache will induce the patient to have his teeth seen to. The second difficulty consists in persuading the patient to submit to the treatment advised, and is less easily surmounted. The ordinary patient employs two criteria and two only in judging of the soundness or otherwise of his teeth, and if they both enable him to bite his food and cause him no pain he supposes them to be healthy. One can hardly be surprised, therefore, if he hesitates to have what he believes to be healthy teeth extracted in bulk for a condition of his gums which he can neither understand nor appreciate. Sternness in refusing all treatment until the oral condition has been dealt with is the best method of overcoming this difficulty, while a great deal can be done by getting patients who have derived benefit from the removal of their teeth to talk to the more refractory cases.

TABLE I.—*Cases of Chronic Pulmonary Tuberculosis which showed Improvement.*

No.	Age and sex.	Diagnosis.	Condition, and how treated.	Result.	Weight, how affected.
1	33, F.	C.P.T.*	Pyorrhœa. Septic teeth removed.	Improved.	Gained 3 lb.
2	45, M.	C.P.T.	Pyorrhœa. All removed.	Marked improvement.	No gain.
3	50, F.	C.P.T.	Pyorrhœa. All removed.	Marked improvement.	Gained 5 lb.
4	49, F.	C.P.T.	Pyorrhœa. All removed.	Marked improvement.	,, 6 lb.
5	40, M.	C.P.T.	Pyorrhœa. All removed.	Improved and restarted work.	No gain.
6	45, M.	C.P.T.	Pyorrhœa. Septic roots removed.	Improved.	Gained 3 lb.
7	55, M.	C.P.T.	Pyorrhœa. All removed.	Improved and restarted work.	No gain.
8	25, F.	C.P.T.	Pyorrhœa. All removed.	Marked improvement.	Gained 1 st.
9	29, M.	C.P.T.	Pyorrhœa. Some removed. (Sanatorium.)	Improved.	,, 7 lb.
10	23, M.	C.P.T.	Pyorrhœa. All removed. (Sanatorium.)	Improved.	,, 4 lb.

* C.P.T. = Chronic pulmonary tuberculosis.

In Table I. are the cases of undoubted pulmonary tuberculosis which improved after the removal of oral sepsis. The disease in all cases was of the chronic type. Two, Nos. 9 and 10, had sanatorium treatment, so that their improvement as the result of dental treatment is not proven. In the other 8 cases there was well-marked improvement, and Nos. 7 and 5, though they did not gain weight, both became well enough to resume the work which

‡ Did not improve till date of vaccine commencement.

they had given up some months previously—a more important criterion of improvement than weight.

Table II. shows the cases of undoubted pulmonary tuberculosis which did not improve after the mouth was cleaned. Six out of the 10 cases remained unaltered. In 4 the steady progress of the disease was in no way arrested. In these 4 cases the disease was active. In no case did dental treatment appear to have a definitely bad effect on the patient.

Table III. shows 15 cases of doubtful pulmonary tuberculosis which improved after radical treatment for oral sepsis. Perhaps none of these cases were tuberculous. Most of the patients have been discharged well or have ceased to attend of their own accord. One of the most striking cases was No. 13. This woman had been under treatment for years at different institutions, her case always being diagnosed as "? pulmonary tuberculosis." No. 7 should, perhaps, not be included in this list. This patient was suffering from a chronic influenzal infection, and though her mouth was in a very bad state and was cleaned, there was no improvement until the case was treated with a vaccine of the influenza bacillus which was isolated in pure culture from the patient's sputum.

4	45, F.	? C.P.T.	"	"
5	22, F.	? C.P.T.	"	"
6	30, M.	General debility. ? C.P.T.	"	"

* C.P.T. = Chronic pulmonary tuberculosis.

Table IV. is a list of the cases of doubtful pulmonary tuberculosis which did not show any improvement after dental treatment. These patients may be those who are really tuberculous.

The numbers in Tables III. and IV.—viz., out of 21 patients 15, or 74 per cent. roughly, showing well-marked improvement—have been sufficiently encouraging to lead me to turn my attention more thoroughly this year to the eradication of oral sepsis in my patients with already increasing good results.

Last year 150 cases were examined and treated by the dental surgeon in the department, but in this article I have only dealt with those cases in whom the report was "Sepsis; advised removal of all," and on whom the treatment was fully carried out. My thanks are due to Mr. R. McKay and his assistant, Mr. W. H. Dye, who have given such an immense amount of time and trouble to the

AURICULAR FLUTTER FOLLOWED BY PAROXYSMAL AURICULAR FIBRILLATION.

BY E. B. GUNSON, M.D. EDIN., M.R.C.P. LOND.

(*From the Cardiac Department, London Hospital, E.*)

AURICULAR flutter is a condition in which the normal auricular contractions are replaced by rhythmical contractions arising at a greatly increased rate from an abnormal focus in the auricle. Some degree of heart block is usually present, the ventricle responding in many cases to alternate auricular impulses; in other cases the response is less frequent. A varying block may result in an irregular pulse.

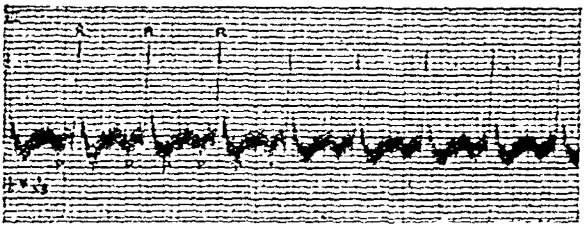
In auricular fibrillation the auricular contractions are replaced by a continuous fibrillary movement of the auricle. The ventricular response is haphazard and gives rise to complete irregularity of the pulse.

By means of the electrocardiograph it is easy to recognise these two conditions. The contracting heart muscle gives rise to an electric current, which is conveyed to a string galvanometer by means of two wires connected with the patient's body. The current produces deflections of the string, which are recorded on a moving photographic plate. From this plate the electrocardiogram is printed. In the illustrations the rise P corresponds to the auricular systole, the rises R and T to the ventricular systole. The P–R interval, the measure of the time occupied by the passage of the impulse from the auricle to the ventricle, is normally less than one-fifth of a second.

In all probability the majority of cases of paroxysmal tachycardia are due either to auricular flutter or to auricular fibrillation. The present case is an illustration not only of this fact, but it also shows the close relationship which exists between the two conditions.

The patient, aged 68, was admitted to the London Hospital on August 25th, 1913, under the care of Dr. James Mackenzie. Fifty-two years ago, when aged 16 years, he had an attack of acute rheumatism and was an in-patient of St. Bartholomew's Hospital. Four years later, when aged 20, he had a second attack of acute rheumatism and was an in-patient of the London Hospital. On discharge he had a systolic murmur at the base, but no other abnormal physical signs. Forty years ago, when aged 28, he had ague. For the past 25 years he had suffered from a winter cough, which had become more severe in recent years. Six years ago, when aged 62, he had pneumonia. He had been unable to work for four years owing to præcordial pain, which was readily induced by exertion and accompanied by a "choking sensation." General weakness and shortness of breath had gradually developed during the same period. For 15 months he had been subject to severe anginal attacks. The pain, which was accompanied by a tightness in the chest and a feeling of suffocation, affected the upper part of the chest, especially the second left interspace, and extended down the inner side of the left arm to the an anxious expression. He was at once admitted to the ward. The radial pulse was regular, with a rate of 155 per minute. An electrocardiogram showed the presence of auricular flutter, with 2:1 heart block. (*See* Fig. 1.) The apex beat was palpable in the sixth space, 6 inches from the mid-line. Deep cardiac dullness extended 1½ inches to the right and 6 inches to the left of the mid-line. The heart sounds were present and unaccompanied by murmurs. There was dullness at the base of the left lung; crepitations were present at both bases; rhonchi were general. The liver extended 4½ inches below the costal margin. There was no œdema. The urine contained a thick cloud of albumin. The Wassermann reaction was positive.

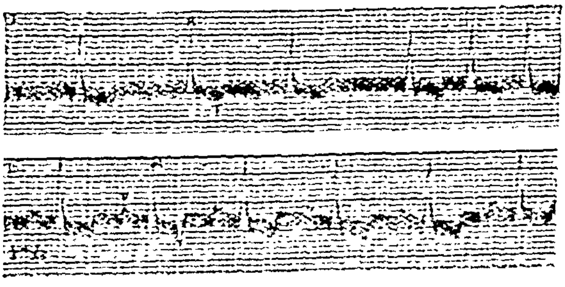
FIG. 1.



Electrocardiogram, Oct. 30th, 1913. Auricular flutter with 2:1 block. Auricles 320 per minute. Ventricles 160 per minute. The rise P indicates the auricular systole and the rises R and T the ventricular systole.

Course.—Polygraphic tracings were taken daily and electrocardiograms were taken when the nature of the rhythm was doubtful. Respirations numbered 20 to 30 per minute. The quantity of urine varied from 30 to 70 ounces per diem, the large amount being recorded after digitalis administration. The albumin diminished in amount and disappeared before discharge. The temperature remained normal and subnormal throughout. For several days after admission the patient's symptoms of distress persisted and he occasionally had Cheyne-Stokes respiration. Deep cardiac dullness and liver dullness increased slightly. On Sept. 1st digitalis was given for the first time. On the 4th, 10 days after admission, coincident with the onset of auricular fibrillation, the patient was distinctly more comfortable. He had then taken 2½ drachms of tincture of digitalis. After this date paroxysms of auricular fibrillation were frequent. The patient did not know when the changes in rhythm occurred, and they were not accompanied by any definite change in the other physical signs, but he was more comfortable when the rhythm was normal or when auricular fibrillation was present than during the paroxysms of auricular flutter.

FIG. 2.

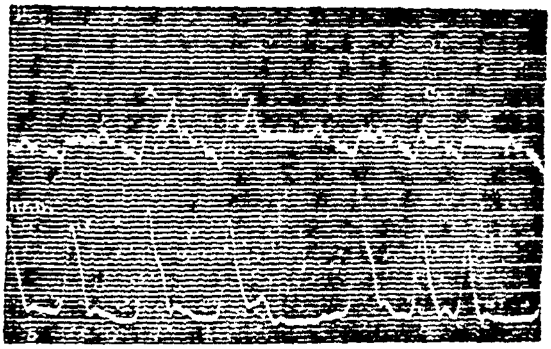


Electrocardiogram, Sept. 25th, 1913. Lead I.: Auricular fibrillation, approximately 96 per minute. Showing the absence of the rise P. Lead III.: Normal rhythm, 92 per minute. P = Auricular, R-T Ventricular systole. (Lead III. was taken immediately after Lead I.)

The patient was discharged on Nov. 30th, 1913. Before this he was able to walk about the ward with but slight shortness of breath. There was no œdema and no ascites. Deep cardiac dullness extended 1¼ inches to the right and 4½ inches to the left of the mid-line, compared with 1½ inches and 6 inches on admission. Liver dullness extended 2 inches below the costal margin, as compared with 4½ inches on admission. The pulse-rate was 87 per minute and the rhythm normal.

Changes in cardiac rhythm.—During his stay in hospital from Oct. 25th until Nov. 30th the patient showed a great variety of cardiac irregularities. There were two paroxysms of tachycardia due to auricular flutter. The first attack continued from August 25th until Sept. 4th, the second from Oct. 28th until Oct. 31st. There were two paroxysms of tachycardia, with a radial pulse-rate of 150 per minute, during which auricular flutter was suspected, but of which conclusive records were not obtained. There were 13 paroxysms of auricular fibrillation, the offset of two paroxysms being recorded. (See Fig. 2.) The first paroxysm was the longest and continued for nine days; the shortest lasted for three and a half hours. Premature auricular contractions, premature ventricular contractions, and interpolated extrasystoles all occurred when the rhythm was otherwise normal. (See Fig. 3.) Alternation of the pulse was frequently present during flutter and also during periods of normal rhythm. The various changes which occurred in the heart's rhythm, and their relation to digitalis administration, are shown in the accompanying table.

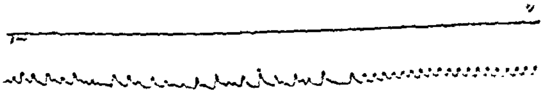
FIG. 3.



Electrocardiogram, with radial tracing, Sept. 17th, 1913. A, Premature and interpolated ventricular contraction. B, Premature ventricular contraction. C, Premature auricular contraction.

On Dec. 4th, four days after discharge, the severe thoracic pain returned, extending down into both arms, especially the left, leaving the fingers numb. The pain persisted; it was accompanied by shortness of breath, and soon followed by œdema of the legs. On examination at his home on the 17th the patient was dyspnœic and in great pain. There was moderate œdema of the legs. The liver extended 4 inches below the costal margin. The heart sounds were distinct at all areas; no murmurs were heard. A radial tracing showed a regular rhythm of 140 per minute. Pulsus alternans was present. On the 26th the patient was again seen at his home. Thoracic and abdominal pain had been very severe since the last visit. The heart sounds were unchanged. Radial tracings only were obtained and showed a regular rhythm of 136 per minute, with pulsus alternans. No irregularity of the pulse was noted by the medical attendant at subsequent visits. The patient became gradually worse and died on Jan. 1st, 1914. No necropsy was obtained.

FIG. 4.



Radial tracing, Sept. 25th, 1913. Offset of auricular fibrillation. Rate during auricular fibrillation approximately 110 per minute. Rate during each of five successive periods of six seconds, after the onset of normal rhythm, 83, 90, 92, 94, and 92 per minute.

Summary.—A fatal case of myocardial failure has been described in which auricular flutter gave

place under digitalis to auricular fibrillation on two occasions. An intervening period of normal rhythm was interrupted by numerous paroxysms of auricular fibrillation.

I am indebted to Dr. John Parkinson for assistance in the preparation of this article.

THE BACILLUS OF BOVINE TUBERCLE AS A FACTOR IN PHLYCTENULAR AFFECTIONS OF THE EYE.[1]

BY SYDNEY STEPHENSON, M.B. EDIN., F.R.C.S. EDIN., D.O. OXON.,
OPHTHALMIC SURGEON TO THE QUEEN'S HOSPITAL FOR CHILDREN, LONDON.

THE close relationship subsisting between phlyctenular affections of the eye on the one hand and "scrofula" or "struma" on the other has been known from early times, and was mirrored forth in the names "scrofulous" or "strumous ophthalmia" bestowed upon the disease by the older writers. After the discovery by Robert Koch in 1882 of the tubercle bacillus the clinical use of the word "scrofula" or "struma" became much restricted, if not actually abandoned. That tendency, as might be expected, was reflected in the nomenclature of the eye disease under discussion. The suggestion made many years before by the famous Dr. William Mackenzie, of Glasgow, that for the word "strumous" the word "phlyctenular" should be employed was very generally adopted in this country, and is so still. One never hears of "strumous ophthalmia" in England nowadays. Some of us, however, remained keenly alive to the fact that the ocular disease was frequently associated with the symptoms once termed "scrofulous," but now generally spoken of as "tuberculous."

About 14 years ago[2] I published an account of my personal investigations into the etiology of what may conveniently be termed "phlyctenulosis." Among a total of 669 such cases I found tubercle to be present in 214, or 31·98 per cent. A family history of tubercle was obtained in 72 per cent. of about 800 cases of phlyctenulosis. For purposes of comparison this could be got in 49·72 per cent. of 181 non-ophthalmic out-patients at the Evelina Hospital, London, and in 35 per cent. among 200 such children at the Queen's Hospital for Children, London. These facts and some others led me to express the opinion that a well-marked tendency to phlyctenulosis was to be regarded as indicating that the patient was, or was likely to become, tuberculous.

The general accuracy of my figures was borne out by those published by Dr. Vilmos Leitner some five years later.[3] Leitner found scrofulosis to be present in 45·1 per cent. of 371 children with various diseases of the conjunctiva, as against 88·7 per cent. of 585 children with phlyctenular affections of the conjunctiva. A few years later Dr. L. Weekers, of Liége, found active tuberculosis in 36 per cent. of his 156 phlyctenular cases, while a family history of tubercle was forthcoming in 56 per cent.[4] With the introduction of the various biological tests for tubercle, the opinion formed on purely clinical grounds has been confirmed, extended, and strengthened.

[4] Bulletin de l'Académie Royale de Médecine de Belgique, vol. xxiii., [illegible]

In 1907 I applied the Calmette tuberculin test to the eyes of 6 children, all of whom were affected with long-standing and relapsing ulceration of the cornea, diagnosed as of phlyctenular type.[5] Of these patients two alone manifested obvious tuberculous lesions in other parts of the body. Yet the ophthalmo-reaction was obtained in all of them. Aubaret and Lafon[6] had previously elicited the Calmette reaction in 4 healed cases of phlyctenular disease. Since those early experiments other observers have found that by this method the reaction can be obtained in from 80 to 100 per cent. of the cases of phlyctenulosis.

As regards the injection of tuberculin, in 1907 I obtained a positive general reaction in 4 children suffering from phlyctenulosis. W. Stock[7] had a general reaction in 87 per cent. of 23 patients with phlyctenulæ of the cornea. Weekers[8] obtained a general reaction in 10 cases of phlyctenulosis after the subcutaneous injection of tuberculin, and a focal reaction was observed in 8 of the cases.

The results obtained by Dr. George S. Derby with the von Pirquet method were of considerable importance.[9] Of 43 instances of phlyctenulosis 89 per cent. reacted to the tuberculin, while in nearly 80 per cent. physical examination disclosed evidence of tuberculosis. Weekers[10] obtained a positive cuti-reaction in 91 per cent. of 156 children suffering from phlyctenulosis. In passing, it may be said that the test was positive in only 11 per cent. of the children not affected with phlyctenulosis. The experiments made with von Pirquet's test by Dr. J. A. Jamieson and myself[11] may be briefly quoted. We employed the method in 20 patients, whose ages were from 2 to 12 years, and found that the cutaneous reaction was positive in every instance. A local reaction as regards the conjunctiva or cornea was observed in 8 of the patients. It should be added that 50 per cent. of these patients had more or less obvious signs of tubercle, medical or surgical, while a family history of tubercle was elicited in 75 per cent.

Finally, employing the Moro inunction method, Dr. H. H. Bywater, of Preston,[12] obtained 16 positive results in 16 cases of phlyctenulosis, and Rosenbauch[13] in 50 such cases 96 per cent. of successes.

We may take it, then, that the association between phlyctenulosis and tubercle is proved on both clinical and biological grounds, and can no longer be doubted even by the most sceptical. The connexion, however, has recently entered upon a new and somewhat significant phase. It has been pointed out by Dr. Bywater that the subjects of phlyctenulosis respond to the specific tests for bovine tubercle. For example, in 15 juvenile cases of phlyctenular disease he had obtained a positive reaction in every instance to the Moro inunction test with bovine tuberculin.[14] Twelve of these cases had been previously tested with human tuberculin, applied by the same method, and had reacted positively. In a latter communication[15] Dr. Bywater stated that in 16 cases of typical phlyctenular disease in children from 3 to 17 years of age he had obtained positive results in every single instance, both with the human and the bovine product. In 56·25 per cent. of the patients there was a family history of tubercle. No phthisis was present, but some other signs of tubercle were general in the children, especially enlarged glands.

Dr. Bywater's results appeared to me to be of considerable importance, and so, with the assistance of Dr. L. W. Jeffries, I have recently investigated the point at the Queen's Hospital for Children, London, in 20 children, aged from 17 months to 12 years, who were suffering from various forms of phlyctenulosis. Von Pirquet's method was adopted. In every case a positive result, both as regards bovine and human tuberculin, was obtained. The intensity of the reaction with the two products varied according to the particular patient. Thus, in one-half of the children the reaction was recorded as equal; in 6 the bovine exceeded the human reaction; and lastly, in 4 the reverse was the case.

That the conjunctival phlycten is not a tuberculoma is universally admitted. Nobody has yet succeeded in reproducing tuberculosis by inoculating the anterior chamber of susceptible animals with such products. Tubercle bacilli have not been found in the efflorescence. The lesion itself does not present the histological structure of tubercle.[16] We may well ask ourselves in what way and by what means a focus of tubercle, latent or manifest, is able to produce a phlyctenule of the conjunctiva or cornea. Leber, as is well known, suggested that the phlyctenulæ were the direct result of dead bacilli set free from a caseous focus elsewhere in the body. The hypothesis was supported by a certain amount of experimental evidence. He found that an inflammation recalling phlyctenular keratitis sometimes followed the injection into the corneal parenchyma of dead tubercle bacilli.[17] To this it has been objected that any foreign substance would do the same. Bruns (a pupil of Leber's) produced changes resembling phlyctenulæ by the injection of dead tubercle bacilli into the blood stream.[18]

A somewhat similar view has been espoused by J. B. Nias and Leslie Paton[19] on the ground that in upwards of 50 patients the opsonic index of the blood behaved in a way that was typical of a definite tuberculous infection. In an earlier communication, however, it is to be noted that those authors seemed to think that the condition must be assigned to "tubercle toxins circulating in the blood apart from their bacilli."[20]

The best working hypothesis is probably that set forth with conspicuous ability by Dr. Weekers—namely, that the eye disease is due to the circulation of soluble toxins thrown off by the deposit of tubercle elsewhere in the body. The analogy that he institutes with the so-called "toxi-tuberculides" is very much to the point. Those eruptions, as is well known, occur in tuberculous subjects, and yet tubercle bacilli have not been found in them, neither can they be successfully inoculated into guinea-pigs. Exactly the same may be said of phlyctenulosis. Both the cutaneous and the ocular disease have on occasion been known to follow the subcutaneous injection of tuberculin (Hallopeau). The association of phlyctenulosis and of lichen scrofulosorum in one and the same subjects is, in my experience, not exactly an uncommon event. It may be reasonably suggested that such obvious tuberculous manifestations of the skin as scrofuloderma, lupus, and Bazin's disease (erythema induratum scrofulosorum) bear the same relationship to tubercle of the conjunctiva as is borne by lichen and acne scrofulosorum to phlyctenular affections.

[16] Leber, almost alone among authors, has described the phlyctenule as possessing a tuberculous structure. The nodule, according to his investigations, is composed of polynuclear leucocytes, epithelioid cells, and many giant cells. The vessels of the part show endarteritis. Caseation is not present.

[20] Transactions of the Ophthalmological Society of the United Kingdom, vol. xxvi., 1906, p. 232.

The incidence of bovine tubercle as a cause of disease in human beings is known to vary greatly according to the locality. For example, as regards the Edinburgh district, Dr. A. P. Mitchell found bacilli of the bovine type in no less than 90·27 per cent. of 72 cases of cervical adenitis in children.[21] On the other hand, in Berlin Gaffky found them in not more than 3·84 per cent. among 78 instances of tuberculous glands. Gosio examined the type of the bacillus in 122 cases of human tubercle, and found the bovine variety in 0·81 per cent. only. The infection of human beings by bovine bacilli, indeed, appears to be as rare an event in some cities, as Berlin, as it is common in others, as Edinburgh. The figures brought forward by Dr. Bywater and myself apply to two cities only—namely, Liverpool and London. It will be interesting to see whether they are supported by returns from other cities of Great Britain.

If it can be shown that phlyctenulosis is usually associated with the bacillus of bovine tubercle, then the remedy lies at hand in the shape of a pure milk-supply. It is indeed possible that could such be secured by legislation, as at the moment appears to be very probable in England, phlyctenulosis might become one of the rarer affections of the eye in poor children instead of being, as it is at present, accountable for the vast majority of inflamed eyes in that class. The greatest cause of defective sight in childhood might be largely remedied. At all events, pending legislation, it would certainly seem advisable to sterilise raw milk before giving it to infants and children.

An even larger point, to which attention has been recently directed by an American physician, Dr. Louis C. Ager, of Brooklyn, should not be lost sight of. That observer urges that all children affected with phlyctenulosis should be submitted to expert physical examination for evidences of incipient tuberculosis, and that they should receive suitable treatment for that condition when present.[22] That raises the question whether the ophthalmic surgeon can be said to have discharged his whole duty when he dismisses the child suffering from phlyctenulosis with a little good advice and a pot of yellow ointment.

MEDICAL MAGISTRATES.—Mr. Hugh Stott has just been placed on the commission of the peace for the county of Sussex. Mr. Stott, who resides at Lewes, is medical officer of health to the East Sussex combined districts. He held the office of Mayor of Lewes in 1911-12 and 1912-13.—Dr. Sylvanus Glanville Morris, of Maerdy, Glamorganshire, has been placed upon the commission of the peace for the county of Glamorgan.

A CASE OF FEMORAL HERNIA TREATED BY BONE TRANSPLANTATION.

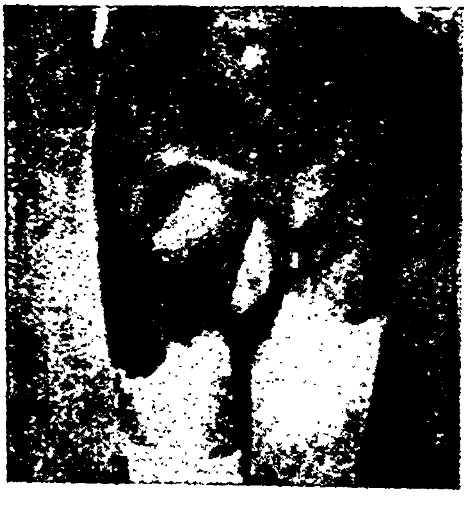
BY W. H. CLAYTON GREENE, M.B., B.C. CANTAB., F.R.C.S. ENG.,
SURGEON TO ST. MARY'S HOSPITAL, ETC.

FROM time to time surgeons have commented on the difficulty of dealing with the opening of a large femoral hernia. The method of approaching the neck of the sac from above Poupart's ligament and the subsequent suturing of the conjoined tendon to Cooper's ligament has given satisfactory results in ordinary cases, but where the opening is exceptionally wide other measures are required, and the implantation of filigree does not seem satisfactory in this situation.

The numerous articles recently published on the subject of bone grafting suggested to me the possibility of closing the entrance to the femoral canal by a bony transplant connected with the pelvis, and in this way increasing, as it were, the pelvic skeleton. The following is an account of a case in which the method was employed.

The patient, a male aged 57 years, was admitted to hospital with a double femoral hernia of about 14 years' duration. That on the right side was very large and caused great inconvenience; that on the left was smaller, but had recurred a year after an operation previously undertaken. (Fig. 1.) The right-sided swelling was reducible, and the whole hand could be introduced into the ring.

FIG. 1.

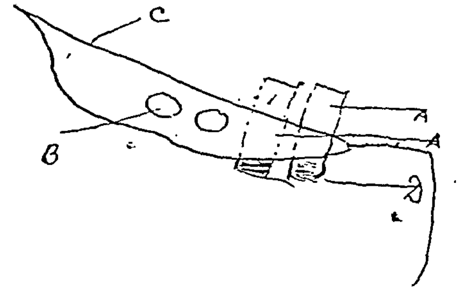


Large right and small left femoral hernia.

An operation was performed on May 28th when the sac was exposed by means of a transverse incision, the contents reduced, and the neck ligatured in the ordinary manner. About two inches of the eleventh rib were then excised subperiosteally and the bone was split into two pieces through the cancellous tissue. The femoral wound was then widely retracted and the bone grafts were introduced into pockets made in the periosteum at the back of the pubic bone. There was no trouble in fixing them, and Poupart's ligament was then drawn down to the pectineus fascia, leaving a firm bone plate on its abdominal aspect. The left hernia was dealt with by the ordinary method. The wounds healed soundly and the bone transplant can be felt firmly in position. The shadow of the transplanted bone can be seen in the X ray photograph.

I am publishing this case as it suggests a method of dealing with large inguinal as well as femoral hernias, and I am not aware of any case in which the method has been tried previously. The advantage of the natural material over foreign bodies such as silver filigrees is obvious, though I do not suggest that a rib is the most suitable site from which to take the graft. On another occasion I shall probably select the tibia.

FIG. 2.



After operation. A A, Bone transplants. B, Femoral vessels. C, Poupart's ligament. D, Pockets in pubic periosteum into which the grafts are fitted.

Note.—Since the above was written the man has been examined again and the bone transplants can be felt firmly in place. There is a good deal of bulging of both inguinal regions, but the femoral canal is quite secure.

Devonshire-place, W.

INTRAPHARYNGEAL ADMINISTRATION OF WARMED ETHER VAPOUR BY THE NASAL ROUTE.

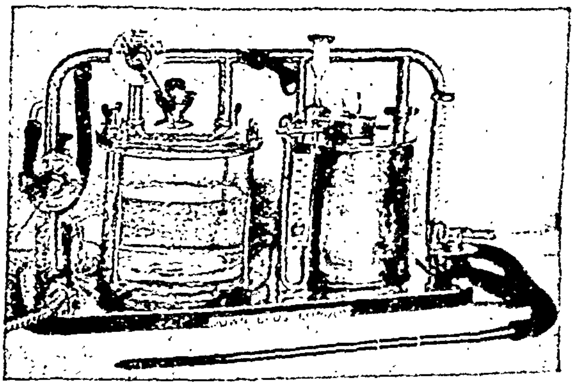
By H. M. PAGE, F.R.C.S. ENG.,

ANÆSTHETIST TO GUY'S AND THE WEST LONDON HOSPITALS.

AT the International Congress of Medicine, 1913, I read a report on Nasal Methods, in which I mentioned the experience of Souchon,[1] Thoms,[2] Pinneo,[3] and myself,[4] with ether by this route. Since then I have made further trial of the method with the help of an intratracheal apparatus. The advantages peculiar to intratracheal insufflation are the power of distending the lung and the prevention of blood and other matters from entering the trachea by means of the back flow of air. The other advantages incidental to the method are an even administration of a warmed ether vapour with the minimum of respiratory effort and the removal of the anæsthetist and his apparatus, with the exception of a tube, from the seat of operation. These incidental advantages can be obtained by intrapharyngeal insufflation.

For those possessing an intratracheal apparatus the method is perfectly simple and easy. A preliminary injection of morphia or omnopon and atropine, combined with scopolamine if desired, is of advantage in the case of adults, but is not necessary. Anæsthesia is first induced by one of the usual methods or drugs. If in a particular case a very light anæsthesia is indicated it is only necessary to produce a sufficient depth to enable the nasal tubes to be passed, but generally it is best to induce full surgical anæsthesia. Indiarubber catheters of suitable size are passed through the nares into the pharynx behind the tongue; they are coupled up with the delivery tube of the apparatus by means of a Y-piece, and the warmed ether vapour is delivered over the glottis. In some cases in children, for example harelip, I have found one tube to be sufficient.

The question of positive pressure used is, of course, quite unimportant as compared to the use of an intratracheal tube, but as I have found that the respiratory movements are less than normal with this method, though oxygenation is excellent, and as it must be possible to raise the intrathoracic pressure by closing the mouth if the nasal tubes fit closely, I have always set the safety valve of the apparatus to blow off at 15 mm. Hg. The pressure used as recorded by the manometer has been 3 to 10 mm. Hg. The mouth can be kept more or less closed according to the depth of anæsthesia required, but there must always be a way for expiration. As a matter of fact, in the majority of cases the mouth need not be interfered with at all. In some of my first cases, if resistant and "full" ether required, there was so much cooling of the ether that the dew was frozen on the outside of the reservoir with consequent loss of evaporation and weakening of the anæsthetic vapour, but the apparatus I now use is one of Kelly's latest pattern, to which Messrs. Down Bros. have added a simple water jacket to the ether reservoir as seen in the diagram, and this trouble is done away with.



To the left of the glass bowl forming the water jacket is seen the supply tube which is connected with an electric motor blower or foot bellows. The delivery tube is shown below.

The kind of cases in which I have successfully used the apparatus in this way are cleft palate, harelip, decompression, glands (neck), goitres, radical cure of hernia, cystoscopy, suprapubic cystotomy, and operations on the trunk and limbs and on bones. I have found it a particularly easy and good way of giving ether to children and I have had no trouble with adults. My youngest patient, aged 10 days, was a bad case of cleft palate with double harelip, another was aged 3 weeks, and there was a decompression in a patient aged 5. I have not yet tried this nasal plenum method in intraperitoneal operations, excepting hernias, but the authors mentioned above report favourably of its use in these cases. In the operations on the neck, such as glands and goitres, there was no trouble from interference with respiration. The absence of exaggerated breathing and the perfect oxygenation impress upon one the importance of the air way in anæsthesia, and point to the seat of obstruction or interference being above the glottis in the majority of cases. The nasal tubes take the place of an artificial air way passed through the mouth and act more efficiently.

I would particularly emphasise the possible advantages of this method in such cases as cleft palate, harelip, and cranial operations in children, in whom from their age and size it is difficult and perhaps inadvisable to pass a tube through the glottis or to use any appreciable increase of intrathoracic pressure, and in consequence chloroform is generally given. This method acts well in operations for goitre. In operations for exophthalmic goitre I consider it better than intratracheal insufflation, as in my opinion there is less chance of producing bronchitis, one of the special causes of death after these operations when done under general anæsthesia, and it obviates the necessity of inducing the deep anæsthesia which is a necessary preliminary to intubation. Full surgical anæsthesia is dangerous in well-marked cases of exophthalmic goitre, and is quite unnecessary in any case of goitre if morphia, &c., has been previously given and local infiltration with novocaine used as well. So far there has been no case of post-anæsthetic bronchitis or pneumonia, and no trouble from after-vomiting.

The important points in connexion with a plenum method by means of nasal tubes as here described are that there is an excellent air way, that the ether vapour is warmed, that the anæsthesia produced, though efficient, is light and even, and that ether can be given in certain cases where chloroform would otherwise be used.

CASE OF PRIMARY CARCINOMA OF LIVER IN A CHILD 3 YEARS OLD.

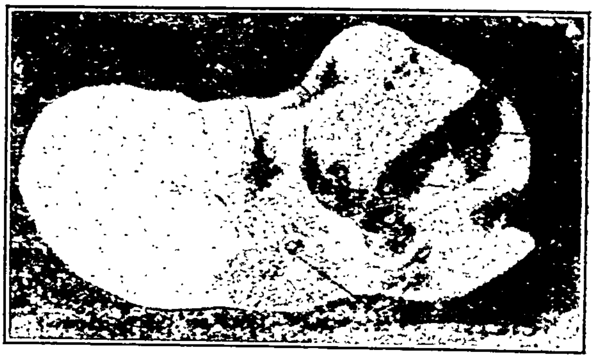
BY W. T. FREEMAN, M.D. DURH., F.R.C.S. ENG.,
PHYSICIAN, ROYAL BERKSHIRE HOSPITAL, READING.

THE patient, a male aged 3 years, was admitted into the Royal Berkshire Hospital under my care on Dec. 10th, 1913. There was a history of abdominal swelling extending over eight months, accompanied with dyspnœa, but with very little belly pain. Upon admission the urine was found to be normal, not containing albumin, sugar, or bile. The bowels were open. The heart was normal; the bases of both lungs yielded a few rhonchial and sibilant sounds. Abdominal examination showed that the belly was enormously distended. In the right hypochondrium for 2 inches below the costal margin a hard (very hard) and somewhat uneven ridge could be felt; this ridge extended across to just within the left hypochondrium. The main mass of the growth grew apparently from beneath this ridge and passed downwards into the right iliac fossa and pelvic region, and to the left an inch beyond the umbilicus and downwards well into the corresponding iliac fossa, but to a lesser extent than on the right side. The spleen was barely palpable and could be differentiated from the liver growth. No lymphatic glands and no other lumps could be felt.

The temperature was normal or subnormal until within four days of death (Feb. 17th, 1914). The abdominal measurements gradually increased from 21 inches on admission (level of umbilicus) to 25½ inches. There was gradually increasing cachexia, but the child took his feeds remarkably well; indeed, was ravenous until within a week of the end. Some vomiting occurred on Dec. 20th, and on Jan. 1st and 2nd, but upon no other occasions. Pain and tenderness during the child's residence in hospital were almost negligible symptoms.

In January the case was exhibited before the Reading Pathological Society, and the diagnosis was one of malignant growth of the liver with a possible alternative of Banti's disease. In this latter connexion the presence of a small amount of ascitic fluid was noticed. The blood examination report soon after admission by Dr. R. Donaldson was as follows: Red cells 4 × 10^6, hæmoglobin 55 per cent., colour index 0·6. White cells 15,000, polymorphonuclears 55 per cent., eosinophiles 4 per cent., small lymphocytes 33 per cent., mononuclears 6 per cent., and transitionals 2 per cent. The red cells showed ano- and polychromasia.

The accompanying figure (reproduced from a photograph) faithfully depicts a section through about the centre of the growth. The bile-stained (AA) and blood-stained (BB) portions were the only parts of the tumour showing some approach to normal liver tissue. A small amount of peritoneal fluid was found after death. No secondary growths were discovered anywhere. The mass weighed 51 oz.



The points of interest appear to me to be the primary malignant growth of a carcinomatous nature in a child of only three years of age, the absence of all secondary deposits, and until the end was quite near the comparative absence of pain, tenderness, or of decided dyspepsia or anorexia. Dr. Donaldson is publishing at a later date a detailed macroscopical and microscopical description.

Reading.

LITERARY INTELLIGENCE.—Mr. Henry Kimpton announces the following works for publication: "Gonorrhœa and its Complications in the Male and Female," by Dr. David Watson; "Practical Pediatrics: A Modern Clinical Guide in the Diseases of Infants and Children for the Family Physician," by Dr. James H. McKee and Dr. W. H. Wells; "The Diagnosis and Treatment of Digestive Diseases," by Dr. G. M. Niles; "Nutrition: A Guide to Food and Dieting," by Mr. C E. Sohn; "Surgery, its Principles and Practice, for Students and Practitioners," by Dr. A. P. C. Ashhurst; and also a second edition of "Practical Therapeutics," by Dr. D. M Hoyt.—It is intended that in the future the St. Bartholomew's Hospital Reports shall be published in three parts each year; the first two parts containing scientific and clinical papers, the remaining part the hospital statistics, &c. It is hoped that these parts will appear in July, December, and March of each year. The first part will appear at the end of the present month.

Clinical Notes:

MEDICAL, SURGICAL, OBSTETRICAL, AND THERAPEUTICAL.

CASE OF SEVERE INJURY TO AN EYE FROM THE CONTENTS OF A GOLF BALL.

BY WALTER H. H. JESSOP, M.B. CANTAB., F.R.C.S. ENG.,
SENIOR OPHTHALMIC SURGEON TO ST. BARTHOLOMEW'S HOSPITAL.

THE following case is interesting in demonstrating an unexpected accident. To most people a golf ball means a ball made solely of rubber. The eye of the patient whose case is here noted was very severely injured (and it is still doubtful how much his vision will be interfered with) in the course of discovering that some rubber golf balls contain other material than rubber.

The patient, a man aged 43, on June 9th was cutting away with a knife the substance of a zone zodiac golf ball to show its construction to a friend, when the core of the ball was pierced. This was followed suddenly by a discharge of a semi-fluid caustic substance with such force that it was deposited on the ceiling, about 10 feet high, and also thrown laterally. Unfortunately the patient's eyes were open, and the substance hit the right eye with great force, covering the cornea and conjunctiva with a greyish putty-like caustic substance. The eye was washed with boric lotion and this substance picked off in shreds. Mr. N. Rushworth found the external surface of the lids of the right eye very red and swollen; when I saw the case the same evening the ocular and palpebral conjunctivæ were much burnt and ecchymosed, and the cornea hazy. The treatment was olive oil and atropine. The next day the conjunctiva of the right eye was roughened, ashy-grey in colour, and ecchymosed; the cornea had considerable loss of surface, especially at the nasal side. With fluorescine the cornea stained green nearly all over its surface, and there was a marked crescentic deep ulcer at the nasal side.

June 23rd.—The patient has had great pain, especially at night, and there is marked photophobia. Right eye: conjunctiva very rough on the surface, and is in rags from ulceration in the nasal and inferior portion near the cornea; much vascular congestion, small ecchymoses, and chemosis; mucopurulent discharge. The cornea looks more opaque, and the ulcer at the nasal side is about the same; the staining by fluorescine is more marked. Vision: right eye barely counts fingers. Treatment: oil and atropine, fomentations, and the eye to be bandaged as much as possible.

June 26th.—The patient still in bed and in a darkened room. He cannot stand much pressure on the eye by bandage. Photophobia very marked and still much pain. The conjunctiva has still the ragged, rough appearance. The cornea is roughened all over the surface and is greyish in appearance; the ulcer is healing, but nearly the whole surface of the cornea stains with fluorescine.

July 3rd.—The eye looks much better, but there is still much photophobia. The conjunctiva, though congested, is smooth as to its surface. The cornea, hazy all over its surface, does not now stain with fluorescine.

July 6th.—Patient still has photophobia. The conjunctiva smooth, though still congested; cornea very hazy, but surface smooth; pupil well dilated under atropine. Vision, right eye 6/60.

Harley-street, W.

A NOTE ON THE EFFECT OF THE HYPODERMIC INJECTION OF ADRENALIN CHLORIDE SOLUTION.

BY W. MILLER, M.D. EDIN.

THIS note is based on the experience gained by treating during the past two and a half years 11 cases, 8 of spasmodic asthma and 3 of hay fever, with hypodermic injections of adrenalin chloride solution. Four of the patients were males and seven were females, and the ages ranged from 6 to 35 years. The injections were given once a week, and usually numbered eight or ten, but in one case 58 were given. The doses were small, varying from 10 minims of 1:15,000 to 10 minims of 1:5000 solution.

My general conclusions are as follows. About one minute after the injection the patient may complain of a feeling of oppression and sometimes of faintness; there is marked pallor, and the pulse as a rule increased to 110, being small and slightly irregular, and may attain to 130 per minute. These symptoms pass off gradually in from three to ten minutes, the patient grows comfortable, recovers colour and a pulse of good volume, which becomes slower by some ten beats per minute than before the injection, the slowness continuing markedly for some hours.

There are, however, considerable variations from this general story, not only in different individuals, but also on different occasions in the same patient. Thus:—

(*a*) Two patients showed no immediate effect.

(*b*) In a lady aged 25, after an injection of 10 minims of 1:5000 solution, the pulse remained small, rapid, and irregular for three hours, and there was no second stage of slowing and steadying. She felt and looked very ill, and it was some days before she recovered. There was no obvious heart lesion, but the pulse was normally small.

(*c*) A man, aged 34, was little affected by the first injection (10 minims of 1:5000), but after the second (10 minims of 1 : 5000) and third (10 minims of 1:10,000) the pulse, although increased only in rate about 15 beats per minute, became very irregular and remained so for quite 20 minutes. The drug was therefore stopped.

Intravenous injection produces startling results. It occurred accidentally on two occasions with the same patient, a lady aged 33, who was receiving weekly injections and responding in the usual way. On the first occasion the pulse before the injection was 85 per minute, regular, but soft. Ten minims of 1:5000 solution were injected under the skin of the forearm. No vein was noticeable at the site punctured, but on withdrawing the needle a drop of blood followed. Within a few seconds the face and lips became ashen and the patient leant back in her chair murmuring that she felt very ill. Respiration was quick and shallow, the pulse very small and so rapid as to be uncountable. She remained in this state for four or five minutes before improvement was noticeable. After about 15 minutes she was better, but felt rather shaken; the pulse was then 78 per minute, of fair volume and almost regular.

On a second occasion an attack of asthma was just commencing; the pulse was 100 per minute. Ten minims of 1 : 10,000 was given and a drop of blood followed the withdrawal of the needle. Again the same symptoms followed, but although the pulse was not countable, her condition was not so alarming, and after about three minutes began to improve. Within five or six minutes she was quite comfortable, the pulse 80 per minute, regular, and of good volume, while the respiration was normal.

I have never given a series of large doses (e.g., 10–20 minims of 1 : 1000 solution) for asthma, but I have given occasionally a single one for other conditions without noticing any initial lowering of the blood pressure. A colleague, however, who used the drug in a bad case of spasmodic asthma, accompanied by mitral disease, gave 10 minims of 1 : 1000 solution, which immediately relieved the breathing. He repeated this dose on two succeeding days, with the result that the patient's condition became extremely critical owing to delirium cordis. A week later, the heart having recovered and the asthma returning, he gave a single dose, but the heart symptoms followed at once.

The result in asthma is not cure, but temporary relief. That the injections may be utilised to enable other treatment to take effect was indicated by one of my 11 cases. A girl, aged 7, had suffered since the age of 2 from occasional attacks, which had gradually become more frequent and lengthy until they occupied three or four days of each week. There was enlargement of the bronchial glands. The usual remedies had no effect, so injections (10 minims of 1 : 10,000) were given once a week for 58 weeks, during which time general treatment was adopted for the glands. At the end of this time there had been no attack for three months, and since then (July, 1912) there has only been a return on a few occasions when the patient had colds. I do not attempt to generalise from so small a number of cases; I only indicate the points suggested: (1) the difference in the immediate effect of large and small doses is in accordance with physiological results; (2) individual variation in susceptibility may be great; (3) possibly a condition resembling anaphylaxis develops in some cases—for example, Case (*c*) and the case whose notes were sent me by a friend.

ROYAL SOCIETY OF MEDICINE.

SECTION OF OBSTETRICS AND GYNÆCOLOGY.

Exhibition of Specimens.—Utero-rectal Adenomyoma.—Migratory Adenomyomata.

A MEETING of this section was held on July 2nd, Dr. W. S. A. GRIFFITH, the President, being in the chair.

Dr. H. R. ANDREWS showed a Uterus which he had removed after performing Cæsarean section. Labour was obstructed by a carcinomatous growth which had surrounded the external os, but had caused no symptoms. The patient, who was aged 39 years, was admitted to the London Hospital on March 1st, 1914, having been in labour about 24 hours. On admission the pains were strong and frequent. The cervix was rigid and only two-fifths dilated. More careful examination of the cervix found it to be extremely hard and firm feeling, as if a portion of a thick rubber ring pessary had been let into the tissues of the cervix on its anterior two-thirds; the posterior one-third was normal. There was no ulceration, but in front and to the left a raised everted edge could be made out. On examination with a speculum it was impossible to diagnose that it was carcinomatous by its appearance, but a sound sank into the tissue about half an inch with only gentle pressure. Cæsarean section was performed and the uterus then removed. The anterior wall of the cervix above the growth was so thin that it tore in separating it from the bladder. On examination after the operation a hard, white growth was found to occupy all the lower part of the cervix except a little more than an inch posteriorly. Sections showed squamous-celled carcinoma. It was very curious that in this case carcinoma which was sufficiently advanced to cause obstructed labour had produced no symptoms of its presence.—Remarks were made by Dr. HERBERT SPENCER and Dr. AMAND ROUTH.

Mr. JOHN D. MALCOLM showed a specimen of Fibromyoma complicating and masking carcinomatous disease of the cervix uteri. The patient was a healthy looking woman aged 53, who had for years suffered with a fibroma, but of late had very free red discharge and discomfort. On examination there was an obvious fibroid about four inches in diameter at the fundus, but there was also another growth in the region of the upper part of the cervix. There was no ulceration of the tissues, but a diagnosis was made that some active degeneration, either malignant or necrotic, was in progress. On opening the abdomen the fundus contained a large fibromyoma. Slight traction on this caused a laceration of the tissues of the cervix below the tumour, which was now found to be the seat of extensive cancerous disease. The removal of the malignant mass was found to be very difficult owing to its extensive connexions to the bladder and account of a curious mass in the recto-vaginal septum complicating the pregnancy. The pregnant uterus extended 9½ inches above the symphysis, and on its anterior surface was a flat sessile fibroid. There was some hydramnios. The mass in the recto-vaginal septum was ill-defined and soft and spongy in character, not bleeding on digital examination, but on exposing it with a Sims' speculum and touching it with dressing forceps free arterial hæmorrhage followed. The mucosa of the rectum was not invaded. A fragment of the growth was removed through the posterior fornix for examination. Abderhalden's test for pregnancy and carcinoma was faintly positive. The optical test was not done owing to insufficient material. During the following month the case was carefully watched, and it was found that the cervico-rectal growth had increased considerably, compressing the rectum and extending on the right side as far as the sacro-iliac synchondrosis. It was decided to try the effects of radium, and this was done, 100 mgm. of radium bromide being inserted into the middle of the growth, and two other tubes containing 37 mgm. of radium carbonate and 50 mgm. of radium bromide for 20 hours. In June the patient was in good health and the pregnancy apparently normal, with less hydramnios. Locally the cervico-rectal mass had diminished considerably. Nothing further was done, as it appeared that there was a good prospect of spontaneous delivery. Sections of the growth stained by Van Gieson's method showed large masses of typical decidual cells in a stroma of muscle and connective tissue. Within each mass was a cleft, lined by a thin lamina composed of flattened epithelial cells. In one part was a dilated gland tubule lined by low cubical epithelium and completely surrounded by large decidual cells. The histological characters of the growth seemed to be those of an adenomyoma, in which the stroma cells surrounding the gland tubes had undergone decidual reaction. The President thought that the decidual change supported the view that extra- as well as intra-uterine adenomyomata were of Müllerian origin.

Dr. ARCHIBALD LEITCH communicated a paper on Migratory Adenomyomata, with epidiascopic demonstration. He said that it was not uncommon to find endometrial tubules and stroma penetrating for some considerable distance into chinks in the musculature of the uterus where the organ was approximately normal, and in this way adenomyoma started. In the diffuse form of adenomyoma the connexion between the endometrium and the characteristic parts of the tumour was easy to establish; but sometimes the point of entry of the endometrium was restricted and the connexion was difficult to find. Further, in some intramural adenomyomata there was no association between the two, but their histological identity with the former group left little room for doubt that they had migrated from the endometrium. They might be found as subserous pedunculated tumours, or they might be extruded within the layers of the broad ligament. Finally, they might be quite separate from the uterus. A case was recounted of an adenomyoma in the base of the broad ligament still connected to the uterus by means of a very fine, long pedicle. The stage further would have been complete separation, and to explain the presence of a tumour containing glandular epithelium in such a situation the favourite theory was an origin from hypothetical Müllerian or Wolffian duct remains or a metaplasia of peritoneal inclusions. These hypotheses were rejected in favour of the migratory theory. He instanced two cases of adenomyoma of the recto-vaginal septum that had come under his notice. In one of these the gland tubules had actually penetrated the rectal wall as far as the submucosal layer. In both he could trace the tubules into the cervical portion of the uterus, and in both the cervical endometrium had penetrated far into the musculature, both approaching and, he thought, being continuous with each other. He reported in full a case in which a small discoid growth was found on the posterior wall of the uterus opposite to a tumour in the sigmoid loop of the pelvic colon. Both were typical adenomyomata, and the sections showed that the separation between the two was quite recent. He held that the original tumour had migrated through the uterine wall, had adhered to the dependent colon, and that the tubules had infiltrated the wall of the latter. Adenomyomata were infiltrating benign tumours of a migratory character, always arising from the endometrium, and in whatever locality they were finally found they had the markedly typical characters that separated them from all other conditions. He had two cases which had taken on malignant change.

Dr. CUTHBERT LOCKYER opened the discussion which followed on these two papers.—Dr. SPENCER said he did not think that the cases of retro-uterine and sigmoid adenomyositis shown by the President and Dr. Leitch were of endometrial or Müllerian origin; it was well known that the peritoneum formed decidua during pregnancy, and its presence in the case reported by the President was no proof of Müllerian origin. He looked forward to the future history of that interesting case. One of the most disastrous results of radium was the peri-rectal fibrosis it set up. Wolff had found X rays of little benefit in adenomyositis. Dr. Spencer had pointed out a year and a half ago, in discussing Dr. Lockyer's case of excision of the uterus and rectum for this condition, that the researches of R. Meyer, Amann, and Renisch showed that the growth arose in the peritoneal endothelium. The researches of Pick, Orloff, Ivanoff, Opitz, and others, and examination of the speaker's own three cases supported this view, which he was interested to see Dr. Lockyer now adopted. Migration of endometrium and the Müllerian and Wolffian theories did not explain some of the remote adenomyomata, which had been observed in the sigmoid, small intestine, stomach, pleura, pericardium, as well as in the pedicle of a ventro-fixed uterus. Dr. Spencer had in his last case performed hysterectomy and dissected the growth from the rectum with the galvano-cautery. The patient recovered, with normal defæcation. He agreed with Dr. Lockyer that adenomyositis was not a tumour except in the clinical sense. He thought also that the ordinary diffuse uterine "adenomyoma" was not a "tumour," but a hypertrophy and hyperplasia.—Dr. W. W. H. TATE and Dr. HERBERT WILLIAMSON also spoke.—The PRESIDENT and Dr. LEITCH replied.

Dr. GRIFFITH having delivered his Presidential Address, votes of thanks were given to the retiring officers of the section for 1913-14.

UNIVERSITY COLLEGE, LONDON.—In the Faculty of Medical Sciences at University College the following medals have been awarded: Senior anatomy class (silver), E. Sakoschansky; junior anatomy class (silver), G. V. Anderson; senior physiology class (silver), M. Schwartz; organic and applied chemistry (silver), J. de S. Wijeveratne; junior pharmacology class (gold), B. MacLean; hygiene medical course (silver), C. I. de Silva.

OXFORD OPHTHALMOLOGICAL CONGRESS.—The annual Ophthalmological Congress was held at Oxford on Thursday and Friday, July 9th and 10th, under the mastership of Mr. R. W. Doyne. It was attended by rather more than the usual number of members and proved to be one of the most successful yet held. The addresses given in the mornings were extremely interesting and led to some spirited discussions. On Thursday afternoon operations were described at the Eye Hospital by several surgeons, and some cases of interest were shown. On Friday afternoon a discussion was held on the Question of Compensation in Injuries to the Eye. It was opened by Dr. William Robinson, of Sunderland, Dr. Frank Shufflebotham, of Newcastle-under-Lyme, speaking next. Mr. Angus MacNab, Mr. J. Jameson Evans, Dr. J. Gray Clegg, Mr. G. H. Pooley, and Mr. R. J. Coulter also spoke. The annual dinner of the Congress was held in the hall of Keble College on Thursday night, Professor Arthur Thomson being in the chair. After the dinner a discussion on the future of the Congress was held, when it was decided, owing to the success of the meetings in the past, to continue to carry them on in the same way as before. This year the addresses, the scientific and commercial museums, were all held in the Department of Human Anatomy in the University Museum, kindly lent by Professor Arthur Thomson, the fact of them all being under one roof being a great improvement on the previous arrangement. Amongst the distinguished visitors to the Congress from abroad were Dr. Casey Wood, Dr. Wendell Reber, Dr. Brown, and Dr. Gifford from the United States, and Dr. Darier from Paris. The meeting, which terminated on Friday night with the usual smoking concert, reflects great credit on the master and the energetic secretary, Mr. Sydney Stephenson.

Reviews and Notices of Books.

Handbuch der Deutschen Schulhygiene.

Herausgegeben von Professor Dr. Med. HUGO SELTER. Dresden und Leipzig: Theodor Steinkopff. 1914. Pp. 760. Price 28 marks.

THE many pens that have gone to the production of this book have unfortunately not been in collaboration; the same subject is treated twice and even thrice over, nor does the repetition bring out as a rule anything new. Herr Graupner, a schoolmaster, discusses the defects of speech, of the eyes, and of hearing in pages 200 to 216. Professor Drigalski goes over the same ground in more detail on pages 440 to 468, whilst Professor Leubuscher returns to the examination of the special senses on pages 538 to 602. Despite this repetition important matter is omitted; there is no mention of myope schools, which have proved a great success since their introduction in 1908 in London.

Of strabismus Drigalski says that its only interest for the school doctor is the question at what age the child should be operated upon. There is no mention of orthoptic treatment or of treatment by glasses and atropine; both methods have been successfully carried on in young children at school. He recommends a 1 per cent. solution of homatropine for the estimation of difficult cases of hypermetropia. This solution is too weak, and it has been shown that without a mydriatic the results are almost valueless in estimating the refraction of children under 14.

Drigalski regards stammering as a neurosis which can be cured by appropriate physical exercises. He seems to think the failures are due to the exercises not being kept up at home (p. 480). Dr. Flachs more wisely remarks that stammering has many causes and depends upon a neurotic disposition. For successful treatment the whole condition of the child must be taken into account. Graupner has obviously more first-hand knowledge of the defect; he recognises that whilst improvement is *frequent so long as* the stammerer is under the specialist's treatment, the defect practically always returns when the patient leaves the specialist. He therefore regards all the breathing exercises and such like by specialists as treatment by suggestion, and on the whole recommends psychotherapeutic measures. Stammerers ought to be taken in hand as soon as the defect appears; in early years they can be permanently cured without exercises or operations. The paralysing influence this defect has upon the whole character of the sufferer can be realised only

with hygiene of the school building there is no mention of heating by gas, although many advantages have been claimed for this method, based upon the experience of German schools. In ventilation too much importance is still ascribed to Pettenkofer's formulas and too little to the circulation of air, its temperature, and moisture. The section on school lighting omits Engelbracht's (1905) formula: $f = \frac{F}{5} \times \frac{x2}{36}$ —the basis of recent work in school illumination. There is no mention of Harman's photometer, which is in every way superior to Wingen's and much cheaper. The authors, indeed, seem curiously unfamiliar with the school hygiene movement outside Germany. Burgenstein's book contained 27 references to London in the index; this work has but two, one of them is wrongly paged and the other is quite out of date.

School clinics are discussed in a few lines with a reference to The Hague and Lucerne, and Strasburg. We do not recognise Kowentree, who is the authority (without further reference) for the statement that out of four school children only two are willing to have free dental treatment. The clinics at Cambridge, Bradford, and Deptford in this country tell a very different tale. The authors, Drigalski, Flachs, and Leubuscher, who deal independently with the subject, seem to think that the last word in prophylaxis is Jessen's School Clinic. In England we have gone beyond that; the teaching of Sim Wallace and other dentists is bearing fruit in our public health. The work done by Dr. J. Wheatley on the prevention of caries in Shropshire has no right to be passed over in a book on school hygiene. Had modern English teaching on this subject been known the out-of-date and really dangerous diets recommended for children on pages 335 and 336 would not have been published.

It is true that inspection and treatment become an obsession in England; all that seems required by the authorities from the unhappy school doctor is that he should be looking at the mouths of unhappy school children, weighing them, and measuring them at a given rate per hour. The hygiene of education remains almost at a standstill, and here something may be learned from Selter's text-book. Sex instruction is dealt with by Flachs and Drigalski; we cannot, however, agree with either of those doctors that it should be the regular business of the teacher to give children this instruction. Such definite omission of home instruction is a mistake, a remark which, of course, does not apply to college students or to training colleges for teachers.

The Principles of Pathologic Histology.

By FRANK B. MALLORY, M.D., Associate Professor of Pathology, Harvard Medical School; Pathologist to the Boston City Hospital. With 497 figures containing 683 illustrations, 124 in colours. London and Philadelphia: W. B. Saunders Company. 1914. Pp. 677. Price 24*s.* net.

THIS book treats of pathology from the morphological and biological point of view, the author's aim being to portray as far as possible the cellular elements out of which the various lesions are built up, and then to trace the development of the lesions from the simplest to the most complex. In the author's opinion the morphologic side of pathology for many students is a dead subject. The book itself is based, so far as possible, on the study of lesions from the earliest to the most developed—not on what someone has written about them, the pathologic material having been collected during the past 16 years in the Boston City Hospital. As the author modestly states, the book is incomplete, but it affords a framework on which to build in the future.

It is divided into two parts. Part I. (pp. 17–410) deals with general pathologic histology under the following heads: inflammations; retrograde processes and the substances associated with them; special injurious agents and the lesions they produce; and tumors. Part II. is concerned with special pathologic histology (pp. 411–622), including the organs of circulation, respiration, digestion, the urinary and male and female genital organs, the blood-making organs, the organs of the central nervous system and locomotion and other organs—i.e., the adrenal and thyroid glands.

First and foremost what strikes one is the superb quality, artistic representation, and clear definition of the illustrations. Unfortunately, neither the magnification, the method of fixing, nor the methods of staining are indicated. Practically all the illustrations are histological, and only a few represent the naked-eye appearance in disease—e.g., gouty deposits in the ear, hands, and foot, typhoid ulcers, and keloid. Red blood corpuscles are described as "bell- or cup-shaped masses of protoplasm containing no nucleus." This is not the usual acceptation of their shape. Fibrin is described as "a pathologic product out of the serum which has exuded." Is serum the correct word? Under the head of special injurious agents and the lesions produced by them micro-organisms are dealt with. A succinct, well-illustrated account of the various pathogenic bacteria occupies over 100 pages, while a few pages are given to some animal parasites such as entamœba and dysentery, balantidium and trichinella spiralis. The remainder of the first part, pp. 251–410, is devoted to tumours. Their most striking characteristic is their autonomy or independence of growth. In the human body there are some 15 different distinct varieties of cells giving rise to tumours which may be denominated type cells. There are some type cells which do not seem to give rise to tumours (erythroblasts, megakaryocytes). The illustrations are here an outstanding feature.

About 50 pages are given to the pathologic histology of the organs of circulation, but there are no illustrations of the gross visible lesions of the organs concerned. In regard to the pathology of the lungs—unlike what occurs with the heart—toxic lesions play no important part. A little over 20 pages suffice for this subject. Beginning with the œsophagus, the digestive tract is dealt with in about 50 pages. Toxic lesions probably play a more important part in pathology of the liver than in any other organ. The histology of the pancreas is rather fully dealt with, and reference to recent experimental work on this organ is introduced. The chapter on the urinary organs is admirable, the toxic and infectious lesions being the most important. Having regard to the importance of the nervous system, 15 pages seem rather too short for the purpose.

The author has produced a noteworthy book on somewhat original lines—admirably and profusely illustrated—to set forth what he calls the principles of pathologic histology. That being so the reader must not look for a compendium of heterogeneous facts. A solid basis has been laid, and we sincerely hope that the opportunities offered by the Boston City Hospital on the one hand and an early call for a second and enlarged edition on the other will enable him to build largely on the secure foundation.

Diseases of Children.

Edited by Dr. M. PFAUNDLER and Dr. A. SCHLOSSMANN. English Translation edited by HENRY L. K. SHAW, M.D., and LINNAEUS LA FÉTRA, M.D. With an introduction by L. EMMETT HOLT, M.D. Vol. VI.: *Diseases of the Ear: A Work for the Practical Physician.* By ARTHUR J. BEDELL, M.D., Clinical Professor of Ophthalmology, Albany Medical College, Albany. With 130 illustrations. London and Philadelphia: J. B. Lippincott Company. 1914. Pp. 430. Price 21*s.* net.

WE gather from the introduction to this volume that it is an addition to the original treatise on diseases of children, published in Germany, and it is obvious that the attempt to write a book of the size of the one under consideration, of some 400 pages, on diseases of the ear in infancy and childhood, must of necessity be a very difficult task. Indeed, we think it open to question whether such a work is really as imperatively demanded as Dr. Bedell seems to think.

Practically the first hundred pages are occupied by a description of the anatomy and physiology of the ear, and testing of the hearing and ears, which includes the examination of the labyrinth according to the latest methods. The book that Dr. Bedell has given us would more easily, we think, be read as a general treatise on otology than as one dealing especially with children, for he describes sabre cuts as a cause of extradural abscess, although he certainly says they are rare in childhood, a statement with which we are thoroughly in accord. But he is certainly not very clear in describing the connexions which may occur between catarrhal and otosclerotic changes, nor about their differential diagnosis. This subject is a particularly difficult one, and it is a mistake in such cases to be too dogmatic. It is very interesting to notice that in the preface Dr. Bedell suggests that otosclerosis may be present in utero.

We congratulate Dr. Bedell on the excellence of the majority of the illustrations. These are practically all original and very clear and well executed. The book is admirably got up, though, like many American books, it is rather weighty. The best portions of the book are those dealing with the affections of the ear in general diseases, to be found in the final chapters. We cannot help feeling that, although one would be justified in praising this work on diseases of the ear in children as a desirable acquisition, in future editions it is capable of being transformed into a work on general otology which would be very useful to practitioners of general medicine.

A Manual of Bacteriology, Clinical and Applied.

By R. TANNER HEWLETT, M.D. Lond., F.R.C.P. Lond., D.P.H., Professor of Bacteriology in the University of London; Lecturer on Bacteriology, London School of Tropical Medicine, &c. Fifth edition. London: J. and A. Churchill. 1914. Pp. 658. Price 10s. 6d. net.

IT is needless to review in detail or to describe the character and arrangement of this well-known and popular text-book of bacteriology, which has now reached its fifth edition. Suffice it to say that the reader who approaches bacteriology from the standpoint of the medical student, the practitioner, or the medical officer of health will find all that he requires in this work. This edition has been very thoroughly revised, and the alterations and additions, though small, are very numerous, and suffice to bring the information up to date. Fortunately, also, the effect has been to reduce the book slightly in size, though this is in part due to alterations in type.

In the general portion of the book there are some changes, such as the introduction of Dobell's classification and his views on the nucleus, while in connexion with anaphylaxis Dale's striking experiments are given. In the chapters dealing with specific organisms the principal changes are found in those concerned with the streptococci, B. anthracis, B. tuberculosis, B. lepræ, B. typhosus, and Sp. choleræ. Organisms resembling the anthrax bacilli are described, and some of the later work on disinfection in connexion with this disease is given. Spengler's views on the existence of two types of human tubercle bacilli are introduced, with their possible bearing on the interpretation of cases of human tubercle caused by the bovine type of bacillus—cases which the author seems to regard as of relatively slight importance. Henderson Smith's classification of the non-lactose-fermenting bacilli has replaced Löffler's grouping of the typhoid-colon bacilli, while there is an increase in the number of types of dysentery bacilli which are recognised. Further work on the hæmolytic properties of the cholera spirillum is introduced. In the previous edition the increasing importance of the protozoa was recognised, so that the changes in this portion are such only as are required by recent additions to our knowledge. The classification of the yeasts has been altered, and sporotrichosis and thrush are now grouped with the hyphomycetes.

The book, as were the previous editions, is well produced.

Practical Prescribing, with Clinical Notes.

By ARTHUR H. PRICHARD, M.R.C.S. Eng., L.R.C.P. Lond. London: Henry Frowde. 1913. Pp. 397. Price 6s.

Mr. Prichard has adopted the plan of epitomising a number of cases to illustrate the effects of various drugs. These are shown side by side with the prescription sheet and clinical notes. This is a good practical plan and should prove interesting and instructive to students. For example, the course of a case of acute gout is described day by day, together with the treatment adopted and the prescriptions which were given, the reasons for using the various therapeutical measures being fully discussed. An attack of influenza is similarly considered. The various systems of the body are then taken in order, the remarks being based on illustrative cases. The therapeutic methods are on the whole sound and practical. A typical case of mitral regurgitation with failing compensation is described, and stress is rightly laid on the value of rest in such circumstances, and the administration of digitalis is explained at length. The treatment of diseases of the stomach is well given, an interesting case of cyclic vomiting and one of "habit vomiting" in a child being discussed.

We think this work will be found useful in general practice and to students when doing their ward work, and more especially to those who wish to obtain practical knowledge in prescribing.

The Treatment of Neurasthenia.

By Dr. PAUL HARTENBERG. Translated by D. ERNEST PLAYFAIR, M.B., M.R.C.P. Edinburgh, Glasgow, and London: Henry Frowde and Hodder and Stoughton. 1914. Pp. 284. Price 6s. net.

THE very number of books on the psychoneuroses may bewilder the practitioner from the multitude of counsels therein contained. Their variety is sure proof of the absence of any specific for the treatment of neurasthenia and allied conditions. Each successful physician advocates his own methods, for in his hands they lead to the maximum of results. Whether they will do so when applied by others is another matter; the physician does not allude, as a rule, to the personal factor when summarising his own achievements in therapeutics. Dr. Hartenberg's book, however, will meet with the approval of the average practitioner of medicine. It is wise without being pedantic, and practical without being too comprehensive. Some believe in the blunderbuss method of treatment, and load their weapons with every variety of shot in the trust that one or other will hit the mark. There is reason in the methods advocated by Dr. Hartenberg, however, and the reader will readily gather that he writes only of what he has practised and proved. His short, synthetic Chapter XIV., on the course to be followed in the treatment of a neurasthenic, could not, we think, be improved on: it contains the key to success. Another valuable chapter is on the manner in which every neurasthenic should be studied and examined.

Some successful physicians and practitioners of psychotherapy are unable to communicate the secret of their results to others, though with the best will in the world; possibly they themselves are not precisely acquainted with the elemental factors underlying their attainment of results. Dr. Hartenberg is able to indicate the signposts along the *via regia* of successful treatment of neurasthenia, and we heartily commend his book to the attention of the medical profession. The translation reads well, and we can testify to its accuracy in thought and language.

Text-book of Local Anæsthesia for Students and Practitioners.

By Professor Dr. GEORG HIRSCHEL, Heidelberg. With introductory preface by Professor Dr. WILMS. Translated by R. E. S. KROHN, M.D. Lond. With 103 illustrations in the text. London: John Bale, Sons, and Danielsson. 1914. Pp. 181. Price 8s. 6d. net.

THE chief merits of this book lie in the illustrations, which are numerous, well executed, and full of detailed information. The book, indeed, may well be regarded as arranged round these graphic representations of the various local procedures described and the sites over which they are carried out. There is but little general description of the principles involved in local anæsthetisation or even of the general technique and management of cases, but as a pictorial guide this work would be invaluable to anyone gaining his experience in local methods of anæsthesia. And the pictures are, of course, enhanced in value by the descriptive text. The book begins with a historical survey of local anæsthesia, and a short section is devoted to indications and contraindications for the method. The use of morphia in conjunction with local anæsthetics is strongly recommended. Novocaine in 1 or 2 per cent. solutions, to which suprarenin is added, is the generally recommended anæsthetic.

It is evident that local anæsthetics are far more widely used at Heidelberg, and probably in Germany generally, than is the case in this country. One reason for this, no doubt, is that less attention is paid there to the practice of general anæsthesia, and no body of men is to be found comparable to the specialists attached to the large hospitals in Great Britain who make the administration and teaching of anæsthetics their sole work. Dr. Krohn has done his work as translator well.

Surgery of the Vascular System.

By BERTRAM M. BERNHEIM, A.B., M.D., Instructor in Surgery, the Johns Hopkins University, Baltimore. With 53 illustrations in the text. Philadelphia and London: J. B. Lippincott Company. Pp. 104. Price 12*s.* 6*d.* net.

THE surgery of the blood-vessels will become of greater importance, but already we see that, though it is but at the beginning of its growth, it is of considerable value. There is, however, a danger that its progress may receive a check from its indiscriminate and unskilled practice by those who have not appreciated the niceties requisite to attain success. This little book contains full and careful accounts of the technique which has been found necessary for blood-vessel surgery. Chapters deal with the suture of vessels, transfusion, transplantation, the surgery of aneurysm, and the surgery of the heart.

The book is eminently practical; it gives the surgeon who is new to this branch of surgery just the information that he needs, and we consider that it forms a trustworthy guide to the surgery of the vascular system, but the surgeon must not overlook the fact that considerable practice is essential before reasonable certainty of success can be attained. The illustrations are very good.

LIBRARY TABLE.

The Progress of Eugenics. By C. W. SALEEBY, M.D., Ch.B., F.Z.S., F.R.S.E. London: Cassell and Co. 1914. Pp. 259. Price 5s. net.—This book is primarily a propagandist essay rather than a contribution to science. The author's aim is to exhibit the eugenic ideal in its pure form, disembarrassed of all those extraneous and even conflicting objects which tend to create prejudice against it and to hinder its progress. Thus he complains that its advocacy has been made a pretext for the inculcation of class prejudice, has been used as an argument against love, as a reason for unjustifiable operations, for the neglect of infancy, and "for wild talk about lethal chambers and stud farms." Dr. Saleeby insists that none of these things belong to the true conception of eugenics; they are, on the contrary, he asserts, the outcome of a false and shallow materialism with which its aims have nothing in common. It is, he points out, an abuse of Galton's distinction between "nature" and "nurture" to exalt one set of conditions at the expense of the other, the amelioration of both being equally indispensable to that of the race. Hence there is no real conflict between the aims of the eugenist and the social reformer, which are on the contrary complementary and interdependent. The whole of nurture is in fact admitted by the second clause of Galton's definition of eugenics as "the science which deals with all influences that improve the inborn qualities of a race; also with those that develop them to the utmost advantage." The first main division of the book deals with principles, the second with the search for knowledge, and the third with the progress of primary eugenics, positive, negative and preventive. One of the most interesting parts of the last-named section is that dealing with the problem of "the impure dominant"—individuals personally normal, half of whose germ cells carry a defect. The book bears on every page evidence of wide knowledge and enthusiasm. It is, however, marred by a complacency, strangely alien to the spirit of that great man, the founder of eugenics, for whom the author expresses so much admiration.

A Complete Handbook of Midwifery for Midwives and Nurses. By J. K. WATSON, M.D. Edin. Third edition, thoroughly revised. With over 150 illustrations. London: The Scientific Press. 1914. Pp. 360. Price 6s. net.—The author thinks that in a text-book of this kind some of the subjects treated should be those which a midwife would not have anything to do with in the practice of her art. He has therefore endeavoured to give such knowledge as can be assimilated by one who has not had the advantage of the scientific training of the medical student. He thinks that the midwife who has taken pains to become conversant with the theory of the subject will be more ready to appreciate her own dependence on medical assistance in times of difficulty. His aim, therefore, has been "too much" rather than "too little." This third edition has been thoroughly revised and some new illustrations added. The book is a good one of its kind, and although all will not agree with the views of the author as to its scope, as it concerns nurses and midwives only, yet they must admit that he has performed his task well.

The Royal Dental Hospital of London Annual Reports for 1913. London: John Bale, Sons, and Danielsson. Pp. 128. Price 5s.—The original communications in this volume reach a high standard of excellence. Mr. J. G. Turner, in an able paper on dental caries from a clinical standpoint, discusses the incidence of caries in the lower animals, the relation of the disease in man to food, and the mode of attack and progress in the individual. The paper is a very thoughtful and careful piece of work. Dr. Dudley Buxton contributes a paper on the nitrous oxide gas, and Mr. G. H. Berwick, in a thoroughly practical communication, deals with the treatment of difficult artificial dentures. Mr. J. F. Colyer writes on the subject of periodontal disease, and insists on the important relationship between mouth-breathing and the disease. He shows also that in some patients there are considerable toxic effects where the marginal gingivitis is marked and there is but little bone destruction. Dr. H. W. C. Austen records two extremely interesting cases of round-celled sarcoma of the mandible. The reports clearly show that dental surgery has taken its proper place in scientific medicine.

MISCELLANEOUS VOLUMES.

A BATCH of books lies before us having reference to various aspects of the sex problem, which seems to press so insistently on the present age.

With regard to the teaching of sexual physiology and hygiene, an admirable little book that aims to express in simple terms, understandable by pupils of elementary schools, the principal facts of growth and development, first in plant and then in animal life, and gradually to educe the relation of these facts and principles to human life, is *Plant and Animal Children: How they Grow* (London: D. C. Heath and Co., and George G. Harrap and Co. Pp. 230. Price 2*s.* 6*d.* net), by ELLEN TORELLE, M.A. The plan is excellent and will undoubtedly fulfil its express aim of making clear the ideas of evolution, heredity, variation, the effect of environment, and the evolution of sex without ever mentioning the names. These will be self-explanatory when they are encountered later by persons already well grounded in the ideas they represent. By the scheme of instruction adopted in this book the child will gradually and naturally be led up without any shock to the understanding of its own sexual nature.——*The Biology of Sex for Parents and Teachers* (same publishers. 1913. Pp. 105. Price 2*s.* net), by Professor T. W. GALLOWAY, Ph.D., is a more advanced and detailed account of sex facts intended to aid teachers in giving sex instruction. The author points out that, while the common objection is true that mere knowledge does not insure right conduct in any department of life, of those individuals who know the facts in a given situation a larger percentage make right choices than in the case of a mixture of informed and ignorant persons taken at random. We can approve the principles of sex instruction laid down in this book—that such instruction must be properly graded; that it must be different for boys and girls (who should be taught separately, at any rate after the broad impersonal studies of the preliminary classes in physiology); that it should follow on curiosity, but should precede the actual need of instruction, and should be incidental to other teaching; and that mere biology is not enough, all possible help from psychology, sociology, ethics, and religion being accepted.——*Hygiene for Girls: Individual and Community* (same publishers. Pp. 257. Price 2*s.* 6*d.* net), by FLORENCE HARVEY RICHARDS, M.D., is, on the whole, a commendable book. In view of the general teaching of elementary physiology, attention is mainly directed to its applied form—viz., hygiene. The book is in two parts, individual hygiene and communal hygiene. Both are good, but in the second part, while especially commending the sane restraint of the chapter on alcohol, we must take exception to the routine circulation of certain common statements in regard to tobacco, which are unsupported by fact—at least, in this country. The bald statement "Cigarettes are much more injurious than pipes or cigars because the smoke is inhaled" would be more correct if stated "when the smoke is inhaled." Thousands of habitual cigarette smokers never inhale; in fact, we should say that in this country inhaling is the exception. Further, we must altogether demur to the assertion, so often made in the United States, that "opium is common in cigarettes." Many examinations of cigarettes have been, and are being made from

physician or spiritual guide—as he puts it elsewhere, "Some individual teacher may be capable of giving the desired information privately to some individual scholar, with tact and in a few words"—there should follow a policy of reticence. The cultivation of purity must be based on character building and will power, and "how this will power can be cultivated without religious motive and without religious influence is incomprehensible." He quotes the witty saying, "It is now *sex* o'clock in literature and art."——The awakening towards the evils of the venereal diseases is the subject of M. A. CORBETT-SMITH'S *Problem of the Nations* (London: John Bale, Sons, and Danielsson, Limited. 1914. Pp. 107. Price 1*s.* 9*d.* post free). The author, who is not a medical man but a barrister, describes his book as a plain straightforward account of the greatest curse known to civilisation. As lecturer in public health law to the Royal Institute of Public Health he has found the doors of official statistical bureaux and Ministries of Health all over the world unlocked to him, and the names of the several eminent authorities, British and foreign, for whose "courteous and willing assistance" he returns thanks in his preface, lead us at the outset to expect a carefully reasoned statement of the human and sociologic aspects of these diseases. The broad facts are dogmatically summed up in his letter to his godson, which closes the book, while full details and figures on which that summary is constructed are given in the body of the book. As the author says, he has "deliberately set to work, in the guise of a journalist, to pick the brains of the specialists, to put this and that fact together and to build a composite whole"; and regarded from that point of view he has accomplished his aim creditably.

JOURNALS AND MAGAZINES.

The Psychoanalytic Review. A Journal Devoted to an Understanding of Human Conduct. Edited and published by WILLIAM A. WHITE, M.D., and SMITH ELY JELLIFFE, M.D. Issued quarterly. $5 per volume. The Journal of Nervous and Mental Disease Publishing Company, New York. No 1, November, 1913.—Dr. C. G. Jung, of Zürich, contributes an article on the theory of psycho-analysis. It consists of his lectures on the subject delivered in America in September, 1912, and is continued in the next number of the *Review*. Here the reader will find clearly stated Dr. Jung's position in regard to Freudism. He explains how he has moved away somewhat from his original conception of sexual libido, allowing that many important functions have no longer a sexual character, although originally derived from the instinct of propagation. The whole process of development consists in a desexualisation of the libido, which is conceived of rather as energy manifesting itself by vital processes.—Dr. L. E. Emerson contributes a short report of a case of self-mutilation in a young woman of 24. In this case the facts were well known to the patient, and no special psycho-analytic technique was necessary to elicit them; only when they are unknown to both patient and examiner is a special method desirable.—A case of hysterical amaurosis, in which the cause of the blindness was shown to be the patient's desire never to see his wife again, is reported by Dr. Thaddeus H. Ames.—Dr. Smith Ely Jelliffe are abstracted in the *Review*. It will be seen that the scope of the *Review* is wide and ambitious. It deals with much more than the strictly medical aspect of psycho-analysis, and appeals to the student of all phases of psychology.

Parasitology. Edited by G. H. F. NUTTALL, F.R.S., and A. E. SHIPLEY, F.R.S., assisted by EDWARD HINDLE, Ph.D. Vol. VII., No. 2. June, 1914. Cambridge University Press. Price 10*s.* net. Yearly subscription 30*s.*—The Trematode Parasites of North Queensland. II. Parasites of Birds, by William Nicoll, is a further account of the trematodes obtained by the author during the examination of numerous species of Australian birds. In the present paper no less than 11 new species are described belonging to the genera Opisthorchis, Orchipedum, Echinostomum, Echinochasmus, Clinostomum, Hæmatotrephus, and Platynotrema, the latter being a new genus, founded for the reception of two species occurring respectively in the gall-bladder and liver of a stone-curlew.—An Epidemiological Study of Filariasis in Ceylon, by P. H. Bahr, contains useful information regarding this disease, together with a map showing its distribution in Ceylon. Only Filaria bancrofti was found, and here it is definitely nocturnal in its habits. In the endemic areas its distribution is apparently of a most capricious character, for in some of the villages at least 26 per cent. of the adults are infected, whilst in neighbouring villages the inhabitants are quite free from the parasite and its associated diseases.—Studies on Malaria in Ceylon, with Special Reference to its Prevention in Agricultural Districts, by P. H. Bahr, is mainly concerned with malaria in Kurunegala. In this town malaria is mostly of the quartan type, and at least six well-known malaria-conveying anophelines were found. The paddy fields are the main and most extensive breeding areas of these mosquitoes, and therefore the author advises that wet cultivation within town limits should be forbidden, as being the only means calculated to abolish endemic malaria. This measure presents no insuperable difficulties, as may be seen from the perusal of Appendix V. of the paper, where it is definitely stated that the substitution of cocoanut for paddy cultivation is perfectly feasible, and is indeed commercially a profitable venture. This interesting paper is illustrated by maps and numerous plates, which give one a very good idea of the conditions affecting the transmission of malaria in Ceylon.—Observations on the Larvæ of Fleas, by A. W. Bacot and W. G. Ridewood, contain detailed descriptions of the external features, and also notes on the habits, of the larvæ of six species of fleas—viz., Pulex irritans, Xenopsylla cheopis, Ctenocephalus canis, Ceratophyllus fasciatus, Ceratophyllus gallinæ, and Heptopsylla musculi. Figures are given illustrating the various larvæ and also tables in which are summarised the differences in the characters of the larvæ of the six species investigated. This paper will prove very valuable to plague investigators who may be concerned with the rearing or identification of fleas.—The Posterior Stigmata of Dipterous Larvæ as a Diagnostic Character, with Especial Reference to the Larvæ Incriminated in Cases of Myiasis, by Malcolm Evan Macgregor, is a most useful attempt to classify dipterous larvæ according to the characters of their posterior stigmata. Both physicians and entomologists have long felt the want of some method of determining the immature stages of flies, for in cases of myiasis it is rarely possible to rear the larvæ to the adult stage. The author recognises two types of stigmata named respectively the schizotreme and ptychotreme types. Examples are then described of the stigmata of various common diptera, the differences between them being well shown in the excellent photomicrographs accompanying the article.—The Occurrence of Oxyuris Vermicularis in the Human Vermiform Appendix, by J. Alexander Innes and A. Elmslie Campbell, contains the results of a study in Aberdeen of 100 unselected cases of appendicitis, in which the appendices operated on were examined for the presence of intestinal parasites. 17 per cent. of the appendices were found to be infected with Oxyuris vermicularis, but no other parasites were found. Normal appendices showed a much lower percentage of infection, but the proportion is probably higher in children than in adults. The recurrent type of appendicitis was found to be most frequently associated with oxyuris infection, and the authors are of the opinion that there is probably a clinical type of oxyuris appendicitis. The suppurative type of appendicitis has practically no relationship to infection with this parasite. Trichocephalus trichiurus is not often found in the appendix in Aberdeen district, the authors not finding a single example during the examination of over 100 appendices.

British Dental Journal.—The issue of this journal for July 1st contains an abstract of Mr. J. Howard Mummery's paper before the Royal Society on the Process of Calcification in Enamel and Dentine. The author shows that the process is in great part a physical phenomenon, and that the actual deposit occurs in the form of calcospherites. In the formed tissues the shape of the calcospherites is not retained, and it is suggested that as phosphates are added from the blood the calcospherites break down and the disintegrated particles form the finally consolidated enamel. Dr. H. Vallow contributes an article on Tuberculosis in Relation to Dental Disease, and considers that every tuberculous patient should have the teeth efficiently attended to and that the money thus spent would be economically used.

CONFERENCE OF THE NATIONAL ASSOCIATION FOR THE PREVENTION OF CONSUMPTION.

THE Sixth Annual Conference of the National Association for the Prevention of Consumption and other Forms of Tuberculosis was held at Leeds on July 7th and 8th. The Lord Mayor of Leeds, Mr. E. A. BROTHERTON, presided over a well-attended assembly. After the Lord Mayor had welcomed the delegates, Dr. M. E. SADLER, Vice-Chancellor of the University, said that one of the highest duties and most hopeful tasks of a university was to share in the campaign for social welfare. He hoped the University of Leeds would be given means to develop in conjunction with the Leeds Infirmary its medical and pathological researches. He suggested that the economists present by the influence of their teaching might help the country to realise that there were changes which, by liberating the human soul and giving it a sense of greater power and opportunity, might richly repay by their results the initial cost of introduction. The University might also send out yearly a body of young people illuminated by knowledge and possessed of a sense of the duty of public service.

Housing and Tuberculosis.

Sir WILLIAM YOUNGER, in a paper on the House in Relation to Tuberculosis, said that so far as the evidence went the house was clearly a dominant factor in tuberculosis. He referred to his recent observations as a member of the Royal Commission on Housing in Scotland, and said it seemed heart-rending to send persons to sanatoriums if in a few months they had to return to surroundings largely responsible for the original breakdown. He cited the experience of Edinburgh and Glasgow to demonstrate the relation between congestion and insanitary housing and the tuberculosis rate. And the same story could be told for the country. He referred to the great increase in tuberculosis in the islands of the west coast of Scotland since the beginning of the nineteenth century, which was ascribed to the importation of the bacillus by servants returning home, the development of which was favoured, in spite of the open-air life, by the insanitary conditions of the housing there. Edinburgh and Liverpool, he said, showed what could be done by rehousing schemes in reducing the tuberculosis rate.

The Marquis of SALISBURY said that the most important point in building cottages was to build enough of them to avoid overcrowding with its injury to health and morals. He gave some practical hints on cottage building, and said that the garden city limit of ten houses to the acre had had excellent results on the children's health.

Sir ROBERT W. PHILIP said that the hope for the tuberculosis problem lay in projecting a searchlight into the home along scientific and humane lines, not by the inquisitorial visit of a lay officer, no matter what powers he might be endowed with. The future mothers and fathers of the race must be educated by skilled, sympathetic teachers. Men and women were wofully ignorant of the larger measures of healthy living and self protection. The object lesson of the sanatorium must be enforced in the home.

Mr. W. CARBY HALL, chairman of the development committee of the Leeds corporation, described some typical cottage designs which could be built in Leeds at the present price of building materials and labour for about £160.

Dr. J. SPOTTISWOODE CAMERON, medical officer of health for Leeds, pointed out that the phthisis mortality in Leeds had been steadily decreasing. At the Census of 1911 6 per cent. of the houses in Leeds had more than two persons to a room. During the last three years the new phthisis cases reported numbered 3472, and of these 57·9 per cent. lived in houses in which two or more persons occupied one room. Overcrowding in Leeds, as measured by two persons to a room, was greater among those suffering from phthisis than in Leeds as a whole, and among the patients in these crowded houses more than half had not a room, and nearly half not even a bed to themselves.

Colonel G. **Kyffin-Taylor**, M.P., Chairman of the Liverpool Housing Committee, said that Liverpool's experience showed that it was no use tinkering with slums, which must be swept off the face of the earth; and because slum dwellers were unable as a separate family to obtain a separate house, the municipality must see that the people were rehoused. After 12 years' work in the Scotland and Exchange divisions of Liverpool, in spite of all that sanitary science could do, the average mortality for the three years ending 1893 was in the Scotland division exactly the same as in 1873—viz., 35·1 per 1000, while in the Exchange division it had actually increased from 34·3 to 36·7 per 1000. The death-rate began to fall when the corporation began to clear and rebuild, the average death-rate for the three years ending 1913 being in both divisions 29·5, a saving of nearly 6 per 1000. Last year it was for Scotland division 27·5 and for Exchange 28·41. After the municipality began to make bold clearances, combined with rehousing, a fall in the tuberculosis mortality rate of 38 per cent. took place in 17 years.

Tuberculosis in Children.

At the afternoon session Professor R. **Lawford Knaggs**, of the University of Leeds, read a paper on Tuberculosis in Children from a Surgical Point of View. He said that whatever surgical treatment might be necessary at no time ought medical treatment to be omitted, for it was essential in every case of tuberculosis. Surgical procedure was based on one of two principles, either the removal of the disease focus or fluid alone, or cutting wide of that through surrounding healthy parts. The first principle was the only one admissible in certain cases—tuberculous ascites, pleuritic effusion, spinal and some glandular abscesses, and some cases of tuberculous inflammation of bone. The second, by dissection through the surrounding healthy tissues, designed to obtain a clean wound free from infected material, was suitable where the tuberculous trouble was confined within a definitely capsulated organ preventing rapid extension. Many cases of tuberculous glands and renal tuberculosis were best treated thus, and also the large group of bone tuberculosis. In aspirations of abscesses and erasion of joints the first principle was involved; in excisions and amputations the second.

Mr. H. J. **Gauvain**, medical superintendent of the Treloar Cripples' Hospital, Alton, considered the time had come when the knife could be absolutely dispensed with in tuberculosis, except to make good defects arising out of the former treatment. The conservative method of restoring and preserving the part attacked was the treatment of the future. That treatment needed large institutions in which it could be carried on. It was far more neglected in this country than on the continent. Crippling from tuberculosis was almost entirely preventable. He showed lantern slides demonstrating the treatment followed at Alton.

Mr. J. F. **Dobson**, of Leeds, concurred in discouraging operative intervention, and deplored the scarcity of beds whereby improved methods of treatment would become possible. This was due solely to lack of funds.

Mr. H. J. **Stiles**, surgeon to the Edinburgh Children's Hospital, said that in Scotland 75 per cent. of surgical tuberculosis among children was of bovine origin. In 37 per cent. of his operative cases in children there was histological evidence of tubercle in the tonsils, mostly the bovine bacillus. He urged inspection of milk adequate to secure a pure milk-supply.

Professor **Sims Woodhead** said every single measure—better housing, ventilation, adequate rest—against any one of the factors of tuberculosis was of great importance. He asked them as public health authorities to pay attention to each fact mentioned by the various experts.

Dr. **Nathan Raw**, of Liverpool, also emphasised the importance of milk as a causative factor.

Mr. [illegible] **Anthony** [illegible], of Liverpool, described the electrical sterilising process for milk in use in Liverpool.

In the evening Dr. **Nathan Raw** delivered the popular lecture on tuberculosis in association with the Tuberculosis Exhibition before a large audience, and particularly emphasised the need for suppressing the spitting nuisance.

The Prevention and Treatment of Tuberculosis.

On the second day Sir **William Osler** read a paper in which he divided the tuberculous public into three classes. In the first nearly all of those present were included, for probably some small tuberculous focus could be found in 90 per cent. of all people. That we did not all die was due to the fact that the human race had attained a certain measure of immunity. The second group comprised those in whom the disease was active enough to produce symptoms, but in whom cure was still possible, with restoration to working health. The third group consisted of the doomed, in whom progression took place to a more or less remote end. This was the fate of between 50,000 and 60,000 persons a year. A single problem was linked with each group. In the first it was to give such health of tissues to every unit, child or adult, in the kingdom, that the parasites might be as surely dealt with as the oak dealt with those on its bark. When the children enjoyed their proper heritage of health, the workers had a living wage, the houses were homes, and the nation spent in food what was now being spent in drink, there would be millions instead of hundreds of thousands of immunes. The problem of the second group concerned the 250,000 to 300,000 people with cough, loss of weight, fever, bacilli, and definite signs in the lungs or obvious involvement of some other part. There were three essentials to cure—education, control, and a rigid regimen. These were best obtained in a well-conducted sanatorium, or failing that by institutional treatment. The primary need in every district was a census of the cases. Patients must be made to realise that a long, hard, uphill fight was before them, but with rigid and effective control a regimen as strict as that of a sanatorium might be carried out at home. With regard to the third group, nothing was more important than the care of these chronic incurable cases. Safe care was almost impossible in houses, and an addition to the law was necessary by which segregation could be provided for and where necessary enforced.

On the various aspects of Domiciliary Treatment, papers were read by Dr. H. **de Carle Woodcock**, Dr. **Arthur Dennison**, Dr. **Cecil Wall**, Dr. H. J. **Campbell**, and Mr. H. W. **McConnell**. Dr. **Edgar L. Collis** and Miss **Emily Sadler** dealt with the Factory in Relation to Tuberculosis, Dr. T. D. **Lister** with the Home in Relation to Tuberculosis, and a general discussion ensued, in which Dr. **Halliday Sutherland**, Dr. A. **Christy Wilson**, Mr. **Harry Kew**, Major **Dod**, Mr. J. **Sullivan**, Dr. W. **Osborne Greenwood**, and the Chairman, Lord **Glenconner**, took part. Votes of thanks were passed to the Lord Mayor, the University and its Vice-Chancellor, the Infirmary Board, &c.

CONGRESS OF THE ROYAL SANITARY INSTITUTE.

The twenty-ninth Congress of the Royal Sanitary Institute was held at Blackpool on July 6th to 11th, under the presidency of the Earl of **Derby**. There was an attendance of upwards of 1000. Delegates appointed by over 230 authorities, including many of the over-sea dominions, were present, and there was a considerable proportion of women. Both the scientific and social arrangements were excellent, and the Congress was a great success. In the course of the Earl of Derby's address, delivered on the opening day, reference was made to health in its relation to the army. Whereas some years ago the presence of the military was regarded with misgiving, more especially on account of contagious disease and the soldier's easy carelessness, he urged that now not only could this feeling be no longer reasonably entertained, but also that individual soldiers, by their wholesome training in hygiene, constituted after their discharge healthy units of the community, from whom, indeed, their civilian associates could learn many useful lessons.

Discussions through the week [illegible] themselves into sections and conferences. The sections included sanitary science and preventive medicine, domestic hygiene, engineering and architecture, and hygiene of infancy and childhood.

The conferences concerned representatives of sanitary authorities, veterinary inspectors, medical officers of health, engineers and surveyors, sanitary inspectors, and port sanitary authorities. The variety and range of discussion prevent, in a limited space, notice being taken here at all commensurate with the value of the subjects treated. The effects of the later trend of legislation, especially as regards National Insurance, town planning, and care of children naturally came in for very general notice in many sections.

Working of Insurance Act.—Juvenile Employment.

The paper by Dr. J. Niven, medical officer of health of Manchester, on the Working of the Insurance Act attracted a large audience. He said that this far-reaching measure had not produced any great immediate effect on public health administration except as regarded tuberculosis, though it promised in the future to do so. He noted that so far provision of machinery had prevented local authorities from investigating the exact workings; nor had sufficient time elapsed to allow the determination of incidence and distribution of sickness. After explaining Manchester's provisions for tuberculosis, he questioned the value of the policy of the 6*d*. for domiciliary treatment. He was of opinion "that the effect of the sanatorium clauses of the Act will ultimately be that a great reduction in tuberculosis will occur, but time is required to complete the machinery." The Act, he considered, was in many ways imperfect, but it represented what it had hitherto been possible to accomplish.—In the discussion many points were raised, such as the lack of supervision of children suffering from tuberculosis, the abuse of the union infirmaries by recipients of pensions, and the interest with which England's experiments in insurance are regarded by our colonies.

In the same section a valuable paper was read by Dr. W. Stewart Stalker, medical officer of health of Swinton, in which he referred to juvenile employment. He said that medical inspection in schools had succeeded in obtaining partial or complete school exemption for children under 14 on account of physical disability; for 1912, 246,000 children were thus exempted. But following this step nothing more was done to follow these cases up when they sought employment. It was true that if they entered employment under the sphere of the Factory and Workshop Acts medical supervision again guarded them; but, as a matter of fact, only a proportion (133,000 out of 246,000) sought such employment. Consequently the remaining 113,000 children, already noted as physically questionable, passed uncontrolled into occupations in many cases positively dangerous. Dr. Stalker thought it desirable to extend the range of compulsory notification on the lines of the Factory and Workshop Acts, to coördinate the work of the school medical officers with the factory doctors, and by these means to lessen the chances of children engaging in work incoördinate to their physical capacity.

Other Papers and Discussions.

In other sections the value of training for mothers and the care of early infant life received much recognition. Professor H. R. Kenwood emphasised the importance of education of mothers. He said that an extended and coördinated scheme was required. Some hygiene might be taught in schools, but later training was of more value. Evening classes should be held for young married women, and local authorities should do everything to bring the same into notice and popularity. Finally, the present midwives and medical men could do far more for antenatal and infant hygiene.

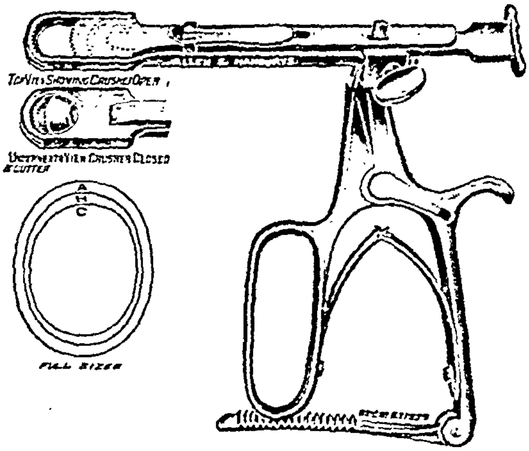
Sir Henry Tanner discussed White Lead and its Disuse for Painting. Mr. T. G. Lumb on Town Planning and Garden Cities, and Mr. Searles-Wood and Mr. Wickford Potter on the Housing of the Agricultural Labourer dealt with matters indirectly concerning practical medicine.—Mrs. Cloudesley Brereton read an interesting paper upon the Modification of Basement Houses.—Professor S. Delépine and Dr. A. Greenwood described their observations upon the Action of some Metals upon Certain Water and other Bacteria. They found that lead, iron, and aluminium, which were acted upon by water, were without appreciable effect (lead) or had only a slight inhibitory effect (aluminium and iron) upon bacterial growth. On the other hand, copper, silver, zinc, and mercury had a powerful inhibitory action; in smaller doses, however, these agents led to increased growth of bacteria. All bacteria were not affected in the same way or to the same extent. While soft water acting upon copper and lead was very rapid, the bact contents were not affected by the passage of lead into water; but copper passing in, was attended with comp or almost complete sterilisation in about half an hour.— sanitation was discussed by Dr. W. M. Willoughby on Plague and the Powers of a Medical Officer of Healt Cope Therewith; by Dr. Herbert Williams on Insanit Conditions on Shipboard; and by Dr. J. Howard-Jo on Diseases Incident upon Seamen and their Preventi These form some of the most suggestive and valuable the papers considered during the week.

An interesting health exhibition was well patronised, a the abundant facilities for excursions and amusements u which Blackpool can rightly pride herself ensured succ for the social amenities of the Congress.

New Inventions.

A NEW TONSILLECTOME.

This instrument was designed for the complete enucle tion of tonsils, removing them with their capsules fro their beds with practically no loss of blood. The meth used is approximately that of Sluder, but in addition to t one cutting blade there is a crushing blade which ente between the anterior faucial pillar and the tonsil a effectually crushes all vessels between the capsule of t tonsil and its bed. When the crushing blade has bee pushed home it remains locked in this position by th Hagedorn catch at the base of the handle of the instrument. A light pair of fixation forceps is then applied to the protruding tonsil (i.e., on the uvula side of the crushing blade) and the cutting blade, which enters between the crushing blade and the tonsil, pushed home. The tonsil is then lifted out on the fixation forceps. The crushing blade being still applied to the vessels which have been cut through may be left on for a few moments, and then gradually released by depressing the catch with the little finger. The method is a simple one. There is no bruising of the faucial pillars or surrounding tissues; no muscular tissue is removed, and in vigorous adults, where the risk of hæmorrhage may be great, it offers the safest possible way of preventing bleeding, in that all vessels which have been cut through can be held just as long as the operator pleases, and when released the proximal ends have been thoroughly crushed by the serrated edge of the crushing blade. The blades of the instrument are made in three sizes (see A, B, and C on the illustration), all fitting one handle, and the one chosen should be of such a size that the tonsil can be just comfortably pushed through the ring. I use a Doyen's mouth gag, but the gag should not be opened to its fullest extent as this tightens the faucial pillars unduly and diminishes the mobility of the tonsil. The fixation forceps are only necessary to prevent the tonsil from falling down when it has been isolated.



The instrument has been made for me by Messrs. Allen and Hanburys, Limited, 48, Wigmore-street, London, W.

MARTINDALE'S AMYL NITRITE CAPSULES

GLASS CAPSULES OF AMYL NITRITE
W. MARTINDALE,
LONDON.

Invaluable in Threatened Fainting and Collapse.

Largely employed in the relief of Angina Pectoris, Spasmodic Asthma, Migraine, Hæmoptysis Sea-sickness, and in all cases where prompt and rapid vaso-dilator effect is needed.

We manufacture ERYTHROL, MANNITOL, and NITROGLYCERIN in Tabellæ form for Treatment of HEART AFFECTIONS.

GOLD MEDAL, INTERNATIONAL CONGRESS OF MEDICINE, 1913.

"TYLCALSIN" *(Martindale)*

(The new Soluble Aceto-Salicylate).

Rapid Antipyretic and Analgesic. Specific in Rheumatic Affections of Joints. In Influenza, Catarrhs, Neuralgia, and Painful Rheumatic Affections, response has been excellent.

Tablets, 7½ grains; Original bottles of 36, **2/6** each.

"TYLLITHIN" *(Martindale)*

(The New Analogous Lithium Compound).

Anti-Rheumatic and Analgesic. Tablets, 7½ grains; Original tubes of 20, **1/6** each.

"STERULES"

Constitute the Ideal Form of Hypodermic Injection.

- *Adrenalin*
- Arsenic and Iron
- Cocodylates
- Camphor
- Colloidal Metals
- Dextrin-Stovaine
- Mercurials
- Morphine and its Combinations
- Quinine Salts
- Tuberculin Dilutions (all kinds.)

Nurses' Registration.

RECENT events have once more brought the problem of nurses' registration into prominence, and it is desirable that every medical practitioner should consider the matter in all its bearings and form some definite ideas, both upon the general question and upon the particular measure which is now before Parliament. With regard to the general question, we suppose there are few of our readers who are not on principle in favour of some form of legislation which would standardise the training of nurses and regularise the conditions under which nursing is practised. To paraphrase the wording of the preamble to the Medical Act of 1858, "it is expedient that persons requiring nursing aid should be enabled to distinguish qualified from unqualified practitioners," and an Act is needed to regulate the qualifications of such practitioners. Some reform of this kind is, we think, called for in the interests of the public, of medicine, and of trained nurses themselves. But there are difficulties in the way of devising and promoting legislation which would achieve what is generally desired without introducing certain drawbacks, and these difficulties are rendered much more formidable by reason of the personal factor which has been imported into the controversy. It would naturally be more pleasant to pass over this aspect of the matter, but the fact seems clear that the present situation cannot profitably be discussed even in outline without admitting that a split exists and that its causes are largely personal as well as

into the House of Commons was permitted by 311 votes to 82, bears a certain likeness in general form and intention to the laws governing the registration of medical practitioners; and assuming that such a resemblance is desirable, it might be supposed that all the best elements in the world of nursing would combine to support a measure of this kind, and that medical men and hospital authorities would with one accord urge the Government to afford facilities for its speedy enactment. But such, of course, is not the case, and this was very clearly stated by the Prime Minister when he received a deputation of supporters of a similar Bill not very long ago. Moreover, it is noteworthy, if not significant, that among the present matrons and superintendents of nursing, who have very numerously signed a petition praying for facilities for the passing of the Nurses' Registration Bill, three only of the 12 great metropolitan hospitals with medical schools are represented. Whence, therefore, the opposition in some influential quarters, and the apathy in others, towards a measure whose avowed object is the benefit of the public through the encouragement of the best class of nursing by defining and safeguarding the status of trained nurses? The answer seems to be that this Bill, excellent in many respects as it is, is the product of one party only, and that within this party the leading spirits, who supply the driving force of the movement, are wholeheartedly committed to a certain line of policy which goes beyond the simple demand for State registration of qualified nurses. Thus there is reason for regarding the present situation not so much as a conflict between the supporters and opponents of State registration, as such, but as an encounter on a grand scale between those who assert and those who deny that it is possible to fix a time limit within which a nurse can be efficiently trained. We recognise that among the vigorous opponents of the Bill now before Parliament considerable appeal to the intelligence; while on the other side there is an equally determined body which makes out a strong practical case for leaving things very much as they are. And, indeed, so long as the London Hospital continues to serve the public and the medical profession so well in the matter of the nurses which it turns out, the advocates of State registration and a three years' curriculum merely weaken their cause by abuse of that institution. The only means by which, as it seems to us, a way out of the difficulty can be found is for the party of reform to recognise that the position cannot be stormed, although by "agreeing with thine adversary" some working measure of State registration might be got through Parliament.

Meat Inspection in the Argentine.

THE Sanitary Committee of the Corporation of the City of London have issued a valuable report made by their veterinary surgeon, Mr. T. D. YOUNG, and presented by their medical officer of health, Dr. W. J. HOWARTH, on the results of inquiries as to the conditions in which meat is obtained and inspected in the Argentine Republic. The object of the inquiry was to assist the City authorities in the duties of supervising the wholesomeness of the meat supply of London which fall to them at Smithfield market and in the large meat stores of the City. Its importance will be realised when account is taken of the fact that practically all the chilled beef which now comes to this country, and more than half of the beef which comes over frozen in quarters, is imported from the Argentine. Mr. YOUNG's report is not unsatisfactory as a whole. The conditions of the Argentine estancias are well known to be extremely favourable for the rearing of fat cattle, and both handling and management previous to slaughter have been developed on practical lines. The slaughtering establishments, frigorificos, and packing-houses appear to vary considerably in their sanitary equipment and are in some cases open to criticism. Objection has to be taken to the unsatisfactory conditions which result from wooden floors and other undesirable structural arrangements, and to places for the preparation of offensive by-products being often in close proximity to the places of slaughter, dressing, and chilling the meat. Codes of regulations providing for the cleanly handling of the meat are in some cases only partially observed, though in others much care seemed to be taken in this respect. On the other hand the large scale of the operations often enables systems to be followed in the Argentine which are in advance of ordinary practices in this country, and Mr. YOUNG notes that this is specially the case in the matter of washing the carcasses.

After a description of the system of economic disposal of the various parts of the animals, the report describes the system of inspection for disease at some length. The chief impression we gain on this matter is that a genuine and serious attempt is made in the Republic to detect and deal with disease in meat on satisfactory lines, and that pressure from this country for improvements in methods would be welcomed by the Argentine authorities. The inspecting staffs are appointed by the Government, which makes a charge to the owners of the frigorificos. Their code of instructions is, on the whole, a satisfactory one, and Mr. YOUNG's principal criticism is that the inspectors are not always distributed among the frigorificos to best advantage and sometimes are deficient in number. His estimate that an inspector cannot examine more than 100 beef carcasses a day without getting tired or inattentive does not seem improbable. In matters of organisation the system followed has some instructive features. A convenient arrangement for dealing with tuberculous meat depends upon the insertion into the carcass of skewers indicating by their colour the organs or glands which have been found affected. This is a very ingenious arrangement, and in other ways the presence of originality and direct thinking among those engaged in the meat trade of the Argentine is displayed. It is noteworthy that the proportion of tuberculous cattle in the Republic has been found to be as high as 4 per cent., and much of the doubt entertained by the City authorities as to the sufficiency of inspection in the Argentine has resulted from the discovery of tuberculous lesions when the carcasses have been cut up in the English markets.

Mr. YOUNG makes a practical suggestion, which is endorsed by Dr. HOWARTH, that in view of the enormous development of the Argentine meat trade a permanent British veterinary officer should be attached to the British Legation at Buenos Aires, with the duty of reporting to the Local Government Board (and for the information of the English meat inspecting authorities) on the efficiency of meat inspection, the classes of meat used, and the conditions of canning of food in the frigorificos and factories. Similar officers already act in London on behalf of various foreign governments, and the suggestion has much to commend it. Since the agitation for better and more wholesome conditions of meat preparation which arose with the so-called "Chicago scandals" about eight years ago the meat industry as a whole has realised that its ultimate interests lie in the promotion of hygienic methods, and health authorities have been much more active in securing the observance of such methods. In this country Mr. BURNS's Food Regulation Act, under which meat inspection is now undertaken at the ports of entry, must be credited with indirectly bringing about great improvements in the conditions of meat inspection and preparation abroad. But there are obvious and sometimes insuperable limitations to the inspection of meat foods when once they have passed the slaughter-house, and this is particularly the case with canned and prepared foods, the export of which from the Argentine may be expected to increase as the meat industry continues to develop there and competition increases. Here it seems probable that a relatively small amount of official investigation and first-hand information at the place of origin could save much of the time and labour now given by inspecting officers at the home ports and markets, and would also produce more efficient control over this important section of our food-supply.

Annotations.

"Ne quid nimis."

THE PREVENTION OF VENEREAL DISEASES.

WE understand that conferences have recently been held, under the chairmanship of Sir Thomas Barlow, to consider the formation of a National Council for Combating Venereal Diseases. Those present have included Sir Rickman Godlee, Sir Francis Champneys, the Bishop of Southwark, Major Leonard Darwin, Sir William Osler, Sir Clifford Allbutt, Sir Henry Morris, Sir A. Pearce Gould, Sir Wilmot Herringham, and Mr. Charters Symonds. It has been decided to form such a national council, consisting of representatives both of the medical profession and the general public. With this object a circular letter is about to be issued stating the objects of the movement, explaining its organisation, and inviting the recipients to join the council. This movement is in no small degree the outcome of the work and recommendations of the special committee of the Royal Society of Medicine, which has been in existence now for over two years, and which originated in a conference between the Royal Society of Medicine and the Eugenics Education Society.

BASEMENT HOUSES.

in domestic organisation and accentuates the difficulties of securing domestic service. Public opinion, in fact, has revolted against the basement house, and the inconveniences of basement rooms in London houses are responsible in great measure for migration to the outskirts and for the large number of empty houses so often found in typical London streets of middle-class dwellings. Property owners might often give more consideration to the question of adapting such dwellings to modern requirements, and would in many cases find themselves well repaid for the capital outlay required. Mrs. Brereton's remedies for the most part consist in removing the kitchen to the ground floor, where it would adjoin the dining-room, and adapting the basement rooms as storerooms, workshops, boxrooms, and the like. In some cases, where there is sufficient space or area in front, the underground room can be opened out to serve as a covered playground or even to store a small motor-car, though the original planning of the dwelling rarely can permit this modification. The number of habitable rooms will be reduced, but this is not always a drawback, and the loss of space can be compensated for by domestic labour-saving appliances. Some of these are suggested by Mrs. Cloudesley Brereton in a manner which deserves attention from those owning or living in houses of the kind here in question.

GOLF BALLS: A WARNING.

THE structure of a golf ball does not attract as a rule the interest of the player; his only concern about it is that its composition shall be durable and such as may add possibly to the flight of the tee shot, and that it shall be true on the green. The ball may possess a power for harm of which he is not aware, but which he certainly should be on his guard against in view of a distressing accident which befel a golfer a short become freely hacked, is likely enough to be the unwinding of its ingeniously wound rubber binding. The ball is, of course, not sold for this purpose, but there are directions now in which the good resilient qualities of the very superior rubber used in a golf ball can be turned to good account and the discarded ball may be selected as a source of this material. It ought to be known that the attempt to recover rubber in this way may be followed with disaster, and we consider that some warning should be issued with those golf balls which contain an inner liquid core of caustic consistency, subjected to the considerable pressure of its tight elastic envelope. As it is, no such warning is issued, though there may exist in the ball all the potentialities of a bomb if it is not carefully handled. Some experiments which we have made with such a ball show that the pressure exists only so long as the liquid core is held tight in the grip of its tense rubber binding. At this stage, if the liquid core is pricked by a sharp instrument, the contents are ejected with great force. If, however, the elastic binding is gradually released or unwound, the liquid core, we find, is disclosed at its full size, having had its pressure gradually relaxed, and the little bag of fluid is then practically incapable of discharging its contents. The bag of fluid, in our examination of balls of similar make to the one with which the accident occurred, consists of a little rubber bottle or flask containing a semi-fluid mass of soft soap or potash soap. The rubber bottle is closed at its neck by means of tightly bound string. Leakage is possible at this point, so that the contents may be discharged without the intervention of a sharp instrument. The potash soap we examined was very strongly alkaline, and no doubt would act as a corrosive in much the same way as free caustic alkali. Most people are aware of the exquisite pain which even soap made for toilet purposes gives when inadvertently the lather gets into the eye. When this happens with a strong, coarse alkaline potash soap used for common scouring purposes it may easily be imagined how intensified the action can be. But in the instance quoted the potash soap was also a projectile which came into contact with the sensitive tissue of the eye with great force. We think that makers of such balls should issue a caution in regard to the dangers of the liquid core existing under the great pressure of the tight rubber folds. For the sake of children who may get possession of old golf balls, we think that it should be widely known that to experiment with the structure of certain varieties is attended with grave risks.

THE PSYCHOSES OF UNDULANT FEVER.

THE symptomatology of undulant fever or Malta fever, as it will be for some time called, is being continually enriched by new elements which tend to characterise more distinctly its clinical course and at the same time contribute towards differentiating it from other septicæmic conditions. Professor A. Cantani has lately[1] drawn attention more especially to the psychical disturbances which sometimes accompany this disease due to the deleterious action of the bacillus melitensis and its products on the peripheral and central nervous system. Certain minor cerebral disturbances are familiar to those who frequently come across cases of Malta fever, and these are characterised by a special state of disquiet and agitation, a sense of complete disinclination and indifference, or at other times an unreasonable and excessive despair in the face of the reappearance of the febrile symptoms, intractable to all remedies and every change of surroundings. Many observers such as Grocco, Tomaselli, and Timpano have already described cases of nervous disturbances of the heart and respiration, dysphagia, hiccough, and obstinate vomiting, with intense headache, photophobia, and delirium; while the work of De Nunno on an experimental basis clearly demonstrated the possibility on the part of the micrococcus melitensis of causing profound histological changes in the nervous system both central and peripheral. The psychical disturbances, while they are found in some cases vaguely marked as part of the general discomfort, rarely assume so prominent an aspect as may be met with in other febrile infective diseases. As a matter of fact, only one case of severe melancholia has been recorded in association with undulant fever, but Professor Cantani now relates a case of the disease, not severe, but well marked, with enlargement of spleen and liver, with tachycardia, where conspicuous psychic phenomena made their appearance during the later stages of the malady, which had already lasted four months. The patient was subject to maniacal attacks, during which he could not be restrained in bed; he bit the sheets, uttered hoarse cries, had hallucinations of persecution, and no longer recognised his own family. In calm moments, on the other hand, he had a fatuous expression, refused food, continually asserted that he could not move his limbs, and was generally incoherent. Professor Bianchi, of Naples, who saw the case, agreed in the diagnosis that the case was one of psychosis of infective disease (undulant fever). It is difficult to explain the fact why psychic disturbances are rare in this disease and comparatively frequent in other infective maladies. For while infection by Bruce's micro-organism is a form of septicæmia benign in comparison with forms caused by other bacteria, and while it is moreover a mild septicæmia owing to the small numbers of bacilli circulating in the blood, it is, on the other hand, remarkable for its protracted duration. More observations on these lines may further tend to confirm the deleterious action of the bacillus melitensis on the central nervous system.

SIGHT IN THE MERCANTILE MARINE.

THE Board of Trade has issued a report on the new sight tests used in the Mercantile Marine. This report covers the period of April 1st to Dec. 31st, 1913. An improved wool test, in which the candidate has to match five colours, and a lantern test were used. The cases of colour blindness are divided into those definitely rejected by the local examiners and those referred for a special examination, the local examiner being doubtful. Of the 286 definitely rejected in the local examinations, 148 failed in both the lantern and the wool test and 138 failed in the lantern test only; there was no failure with the wool test which passed the lantern test. Of the 286, 93 appealed, 26 being successful. Of 125 referred cases, 20 were referred on both the lantern and wools, 101 on the lantern only, 3 on the wools only, and 1 on form vision as well. Of this number there were 30 failures; 3 of these were referred on both the lantern and wool test, 26 on the lantern only, and 1 on form vision as well. Those referred on the wool test alone were passed. From this report it is perfectly evident that the Board of Trade will no longer rely on the wool test, and ophthalmologists presumably will be in accord with the Board.

DISEASES ABOARD SHIP IN THE PAST.

AN interesting document recently presented to the Library of the Royal College of Surgeons of England is a certified copy of the "Medical Log" of a crowded slave-ship, the *Lord Stanley*, which was compiled by the ship's surgeon, Christopher Bowes, in 1792. The present donor, Mr. Arthur Bowes Elliott, F.R.C.S., is the author's grandson. It appears that in April, 1792, the ship being then bound for Grenada, a black girl complained of pain in her bowels and diarrhœa, and was treated with "haust. c. rh. & magn. alb." and a solution of vitriol. Her recovery is noted on the 24th of the month, by which date a boy has been attacked. The disease then spreads to the whole body of slaves, and some 16 deaths are noted. The log ends on July 26th, and with the epidemic still in full swing. The extreme symptoms of the disease are weakness, tremors, pains in the chest and limbs, delirium, and diarrhœa. In an interesting MS. note appended to the document Sir Ronald Ross expresses the opinion that this was perhaps not a regular epidemic. "Quite possibly," he says, "many of the slaves had tried to poison themselves on being captured." Perhaps, however, the blacks were suffering from a form of infantile diarrhœa. It is interesting to note that they are well treated and their cases carefully recorded by the ship's surgeon. Good food, for instance, is furnished them in plenty. Slaves were perhaps likely to fare better than sailors on board ship. Indeed, there is much evidence to show that the sailor was throughout the eighteenth and still more in the seventeenth and sixteenth centuries regarded as a very poor sort of chattel and a fit victim of diseases, the names of which have even not been recorded. Hakluyt's voyages furnish us with many details of epidemics on board ship. During Jaques Cartier's expedition to Newfoundland, for instance, which took place in 1535, his crew were decimated with scurvy, and in 1545 the plague ravaged the English fleet in home waters. Queen Elizabeth's captains wrote home constantly, complaining of the miserably insanitary conditions on board their ships, of the prostration and starvation of their seamen, of rats, mutiny, filth, and sepsis. Most of these horrors have been described at length by Dr. Alan Moore in his thesis for the M.B. degree Cantab., entitled, "An Examination of the Chief Causes of Disease at Sea in the Era of the Tudors and Stewarts, and of the Measures taken Against It." He quotes Captain John Smith's "Accidence for Young Seamen," published in 1626, not so long after the time when the sailors in Shakespeare's "Tempest" were calling out "Yare! Yare!" "Many supposeth," says Smith, "anything is good enough to serve men at sea." The commander should hold a contrary opinion. He should bear in mind the constant exposure undergone by his men, who "must stand to their tackelings" in the worst weather. Smith gives a list of provisions which if carried by most ships would have done much to prevent scurvy. "When a man is ill sicke," says he, "or at the poynt of death, I would know whether a dish of buttered rice, with a little cinamon and sugar, a little minced meate, or roast beefe, a few stewed prunes, a race of greene-ginger, a flap Jacke, a can of fresh water brued with a little cinamon, ginger and sugar, be not better than a little poore John, or salt fish, with oyle and mustard, or bisket, butter, cheese, or oatmeale pottage on fish dayes, salte beefe, porke and pease and sixe shillings beere. This is your ordinary ships allowance, and good for them are well ...... which is not alwayes, as seamen can too well witnesse: and after a storme, when poore men are all wet, and some not so much as a cloth to shift him, shaking with cold, few of those but will tell you, a little sacke or aquavitae, is much better to keep them in health" than beer or water. Of the horrors of foreign navies in the past we know little, but from the fact that the "calenture," a "ritual" disease, led sailors under the influence of fever to jump into the sea and began to be observed as though it were a specific malady at the end of the eighteenth and beginning of the nineteenth centuries, we are led to suppose that life aboard foreign ships was miserable enough.

A NEW SURGICAL HÆMOSTATIC.

IN spite of all that has been done, or attempted, in the effort to discover more perfect means of hæmostasis, hæmorrhage is still one of the prime hindrances to surgical advance. In an article in the *Deutsche Medizinische Wochenschrift* for June 25th Dr. E. Vogt describes the experiences of the gynæcological clinic to which he is attached in Dresden, in the uses of a new styptic named "coagulen," which has, we are told, been in use for some time in the surgical service of Professor Kocher, of Berne, who with his assistant, Dr. A. Fonio, was responsible for its discovery. This substance is a light brown, coarsely granular powder, soluble in ether, chloroform, alcohol, normal saline, and water. It is derived from the blood platelets; by what process, Dr. Vogt does not tell us. The form in which it is employed in surgery is that of the solution in normal saline, sterilised by brief boiling immediately before use. As for its value in surgery the Berne experiences to date lead its sponsors to claim that it brings parenchymatous hæmorrhage to an abrupt end; that for hæmorrhage from vessels of small calibre the simultaneous application of coagulen with artery forceps renders the use of ligatures unnecessary; and that even severer bleeding from larger vessels may be checked by pressure with gauze tampons soaked in coagulen solution. These claims have been thoroughly tested in the Dresden clinic during the past year. In operations for prolapse, in the extensive hæmorrhage that follows removal of intraligamentary tumours by shelling out, in the bleeding from the paravesical veins that may complicate the Wertheim operation for uterine cancer, after extirpation of pelvic hæmatocele, and so on, this new method of hæmostasis seems to have given satisfactory results. Another type of operation in which it proved very useful was the plastic procedure of which posterior colporrhaphy may be quoted as an example. Here the use of coagulen is said to have obviated the use of ligatures and continually repeated tamponage, the former of which introduces foreign material and the latter a source of mechanical injury to the tissues, to the detriment of the operative result. In some such operations it was found possible to dispense become freely hacked, is likely enough to be the unwinding of its ingeniously wound rubber binding. The ball is, of course, not sold for this purpose, but there are directions now in which the good resilient qualities of the very superior rubber used in a golf ball can be turned to good account and the discarded ball may be selected as a source of this material. It ought to be known that the attempt to recover rubber in this way may be followed with disaster, and we consider that some warning should be issued with those golf balls which contain an inner liquid core of caustic consistency, subjected to the considerable pressure of its tight elastic envelope. As it is, no such warning is issued, though there may exist in the ball all the potentialities of a bomb if it is not carefully handled. Some experiments which we have made with such a ball show that the pressure exists only so long as the liquid core is held tight in the grip of its tense rubber binding. At this stage, if the liquid core is pricked by a sharp instrument, the contents are ejected with great force. If, however, the elastic binding is gradually released or unwound, the liquid core, we find, is disclosed at its full size, having had its pressure gradually relaxed, and the little bag of fluid is then practically incapable of discharging its contents. The bag of fluid, in our examination of balls of similar make to the one with which the accident occurred, consists of a little rubber bottle or flask containing a semi-fluid mass of soft soap or potash soap. The rubber bottle is closed at its neck by means of tightly bound string. Leakage is possible at this point, so that the contents may be discharged without the intervention of a sharp instrument. The potash soap we examined was very strongly alkaline, and no doubt would act as a corrosive in much the same way as free caustic alkali. Most people are aware of the exquisite pain which even soap made for toilet purposes gives when inadvertently the lather gets into the eye. When this happens with a strong, coarse alkaline potash soap used for common scouring purposes it may easily be imagined how intensified the action can be. But in the instance quoted the potash soap was also a projectile which came into contact with the sensitive tissue of the eye with great force. We think that makers of such balls should issue a caution in regard to the dangers of the liquid core existing under the great pressure of the tight rubber folds. For the sake of children who may get possession of old golf balls, we think that it should be widely known that to experiment with the structure of certain varieties is attended with grave risks.

THE PSYCHOSES OF UNDULANT FEVER.

THE symptomatology of undulant fever or Malta fever, as it will be for some time called, is being continually enriched by new elements which tend to characterise more distinctly its clinical course and at the same time contribute towards differentiating it from other septicæmic conditions. Professor A. Cantani has lately[1] drawn attention more especially to the psychical disturbances which sometimes accompany this disease due to the deleterious action of the *bacillus melitensis* and its products on the peripheral and central nervous system. Certain minor cerebral disturbances are familiar to those who frequently come across cases of Malta fever, and these are characterised by a special state of disquiet and agitation, a sense of complete disinclination and indifference, or at other times an unreasonable and excessive despair in the face of the reappearance of the febrile symptoms, intractable to all remedies and every change of surroundings. Many observers such as Grocco, Tomaselli, and Timpano have already described cases of nervous disturbances of the heart and respiration, dysphagia, hiccough, and obstinate vomiting, with intense headache, photophobia, and delirium; while the work of De Nunno on an experimental basis clearly demonstrated the possibility on the part of the micrococcus melitensis of causing profound histological changes in the nervous system both central and peripheral. The psychical disturbances, while they are found in some cases vaguely marked as part of the general discomfort, rarely assume so prominent an aspect as may be met with in other febrile infective diseases. As a matter of fact, only one case of severe melancholia has been recorded in association with undulant fever, but Professor Cantani now relates a case of the disease, not severe, but well marked, with enlargement of spleen and liver, with tachycardia, where conspicuous psychic phenomena made their appearance during the later stages of the malady, which had already lasted four months. The patient was subject to maniacal attacks, during which he could not be restrained in bed; he bit the sheets, uttered hoarse cries, had hallucinations of persecution, and no longer recognised his own family. In calm moments, on the other hand, he had a fatuous expression, refused food, continually asserted that he could not move his limbs, and was generally incoherent. Professor Bianchi, of Naples, who saw the case, agreed in the diagnosis that the case was one of psychosis of infective disease (undulant fever). It is difficult to explain the fact why psychic disturbances are rare in this disease and comparatively frequent in other infective maladies. For while infection by Bruce's micro-organism is a form of septicæmia benign in comparison with forms caused by other bacteria, and while it is moreover a mild septicæmia owing to the small numbers of bacilli circulating in the blood, it is, on the other hand, remarkable for its protracted duration. More observations on these lines may further tend to confirm the deleterious action of the bacillus melitensis on the central nervous system.

SIGHT IN THE MERCANTILE MARINE.

THE Board of Trade has issued a report on the new sight tests used in the Mercantile Marine. This report covers the period of April 1st to Dec. 31st, 1913. An improved wool test, in which the candidate has to match five colours, and a lantern test were used. The cases of colour blindness are divided into those definitely rejected by the local examiners and those referred for a special examination, the local examiner being doubtful. Of the 286 definitely rejected in the local examinations, 148 failed in both the lantern and the wool test and 138 failed in the lantern test only: there was no failure with the wool test which passed the lantern test. Of the 286, 93 appealed, 26 being successful. Of 125 referred cases, 20 were referred on both the lantern and wools, 101 on the lantern only, 3 on the wools only, and 1 on form vision as well. Of this number there were 30 failures: 3 of these were referred on both the lantern and wool test, 26 on the lantern only, and 1 on form vision as well. Those referred on the wool test alone were passed. From this report it is perfectly evident that the Board of Trade will no longer rely on the wool test, and ophthalmologists presumably will be in accord with the Board.

DISEASES ABOARD SHIP IN THE PAST.

AN *interesting document* recently presented to the Library of the Royal College of Surgeons of England is a certified copy of the "Medical Log" of a crowded slave-ship, the *Lord Stanley*, which was compiled by the ship's surgeon, Christopher Bowes, in 1792. The present donor, Mr. Arthur Bowes Elliott, F.R.C.S., is the author's grandson. It appears that in April, 1792, the ship being then bound for Grenada, a black girl complained of pain in her bowels and diarrhœa, and was treated with "haust. c. rh. & magn. alb." and a solution of vitriol. Her recovery is noted on the 24th of the month, by which date a boy has been attacked. The disease then spreads to the whole body of slaves, and some 16 deaths are noted. The log ends on July 26th, and with the epidemic still in full swing. The extreme symptoms of the disease are weakness, tremors, pains in the chest and limbs, delirium, and diarrhœa. In an interesting MS. note appended to the document Sir Ronald Ross expresses the opinion that this was perhaps not a regular epidemic. "Quite possibly," he says, "many of the slaves had tried to poison themselves on being captured." Perhaps, however, the blacks were suffering from a form of infantile diarrhœa. It is interesting to note that they are well treated and their cases carefully recorded by the ship's surgeon. Good food, for instance, is furnished them in plenty. Slaves were perhaps likely to fare better than sailors on board ship. Indeed, there is much evidence to show that the sailor was throughout the eighteenth and still more in the seventeenth and sixteenth centuries regarded as a very poor sort of chattel and a fit victim of diseases, the names of which have even not been recorded. Hakluyt's voyages furnish us with many details of epidemics on board ship. During Jaques Cartier's expedition to Newfoundland, for instance, which took place in 1535, his crew were decimated with scurvy, and in 1545 the plague ravaged the English fleet in home waters. Queen Elizabeth's captains wrote home constantly, complaining of the miserably insanitary conditions on board their ships, of the prostration and starvation of their seamen, of rats, mutiny, filth, and sepsis. Most of these horrors have been described at length by Dr. Alan Moore in his thesis for the M.B. degree Cantab., entitled, "An Examination of the Chief Causes of Disease at Sea in the Era of the Tudors and Stewarts, and of the Measures taken Against It." He quotes Captain John Smith's "Accidence for Young Seamen," published in 1626, not so long after the time when the sailors in Shakespeare's "Tempest" were calling out "Yare! Yare!" "Many supposeth," says Smith, "anything is good enough to serve men at sea." The commander should hold a contrary opinion. He should bear in mind the constant exposure undergone by his men, who "must stand to their tackelings" in the worst weather. Smith gives a list of provisions which if carried by most ships would have done much to prevent scurvy. "When a man is ill sicke," says he, "or at the poynt of death, I would know whether a dish of buttered rice, with a little cinamon and sugar, a little minced meate, or roast beefe, a few stewed prunes, a race of greene-ginger, a flap Jacke, a can of fresh water brued with a little cinamon, ginger and sugar, be not better than a little poore John, or salt fish, with oyle and mustard, or bisket, butter, cheese, or oatmeale pottage on fish dayes, salte beefe, porke and pease and sixe shillings beere. This is your ordinary ships allowance, and good for them are well ...... which is not alwayes, as seamen can too well witnesse: and after a storme, when poore men are all wet, and some not so much as a cloth to shift him, shaking with cold, few of those but will tell you, a little sacke or aquavitae, is much better to keep them in health" than beer or water. Of the horrors of foreign navies in the past we know little, but from the fact that the "calenture," a "ritual" disease, led sailors under the influence of fever to jump into the sea and began to be observed as though it were a specific malady at the end of the eighteenth and beginning of the nineteenth centuries, we are led to suppose that life aboard foreign ships was miserable enough.

A NEW SURGICAL HÆMOSTATIC.

IN spite of all that has been done, or attempted, in the effort to discover more perfect means of hæmostasis, hæmorrhage is still one of the prime hindrances to surgical advance. In an article in the *Deutsche Medizinische Wochenschrift* for June 25th Dr. E. Vogt describes the experiences of the gynæcological clinic to which he is attached in Dresden, in the uses of a new styptic named "coagulen," which has, we are told, been in use for some time in the surgical service of Professor Kocher, of Berne, who with his assistant, Dr. A. Fonio, was responsible for its discovery. This substance is a light brown, coarsely granular powder, soluble in ether, chloroform, alcohol, normal saline, and water. It is derived from the blood platelets; by what process, Dr. Vogt does not tell us. The form in which it is employed in surgery is that of the solution in normal saline, sterilised by brief boiling immediately before use. As for its value in surgery the Berne experiences to date lead its sponsors to claim that it brings parenchymatous hæmorrhage to an abrupt end; that for hæmorrhage from vessels of small calibre the simultaneous application of coagulen with artery forceps renders the use of ligatures unnecessary; and that even severer bleeding from larger vessels may be checked by pressure with gauze tampons soaked in coagulen solution. These claims have been thoroughly tested in the Dresden clinic during the past year. In operations for prolapse, in the extensive hæmorrhage that follows removal of intraligamentary tumours by shelling out, in the bleeding from the paravesical veins that may complicate the Wertheim operation for uterine cancer, after extirpation of pelvic hæmatocele, and so on, this new method of hæmostasis seems to have given satisfactory results. Another type of operation in which it proved very useful was the plastic procedure of which posterior colporrhaphy may be quoted as an example. Here the use of coagulen is said to have obviated the use of ligatures and continually repeated tamponage, the former of which introduces foreign material and the latter a source of mechanical injury to the tissues, to the detriment of the operative result. In some such operations it was found possible to dispense altogether with ligatures. Even in the major laparotomies the officers of the Dresden clinic have found coagulen useful; its action in diminishing hæmorrhage they regard as important in its tendency to lessen shock. Among its further advantages are the clearer field of operation which it provides for the surgeon, and the fact that it obviates the necessity of drainage and other inconvenient features of the after-treatment. It has been used in a 10 per cent. solution, higher concentrations having no advantage over this strength. This is sterilised by heat for two or three minutes, *immediately* before use, and *injected into* the bleeding area or into the vessel itself, or applied with gauze soaked in the solution. No untoward after-effects are observed, though a number of the laparotomy cases were allowed to get up on the third day after operation. It is now being applied directly to cases of severe menorrhagia and metrorrhagia, and intravenously in placenta prævia and melæna neonatorum. It is clear that if the experiences of other surgeons go to substantiate those described by Vogt, the substance for which we are indebted to Kocher and Fonio will render further progress in the surgical art in various directions. Clinical experiences with hæmostatics are now being supplied to the medical profession with some freedom; we have published in THE LANCET[1] two notes on the subject recently which may well be consulted.

REMOVAL OF FOREIGN BODIES FROM THE PERICARDIAL SAC.

IN the *Annals of Surgery* for June two rather remarkable surgical feats are recorded. The first case was that of a man aged 46, admitted to the Montreal General Hospital under Dr. G. E. Armstrong, who reports the case, suffering from a wound in the chest inflicted by a 32 calibre revolver at a range of 5 feet. In the third left interspace, near the sternal border, there was a small punctured wound. There was little or no subjective discomfort, but in the afternoon of the same day the pulse became irregular. Skiagraphic examination showed that the bullet lay loose in the pericardial sac, turning to the right when the patient lay on his right side, and vice versa. The pulse became more irregular during the next four or five days, and tracings showed that this was a total arrhythmia of the type that is associated with auricular fibrillation. This, together with a slight change for the worse in the man's general condition, determined the surgeon in favour of operation. The patient was anæsthetised with ether administered by the intratracheal method. The pericardial sac was reached and incised through the fourth left space, but as this opening did not give free access to the bullet a part of the fifth rib was removed. By this means the bullet, which lay behind the heart, was brought within reach of the operator's finger and hooked out of the chest. The pericardial sac contained so little blood that the incision was closed without drainage. Within a few hours the rhythm was normal once more, and the patient seems to have done well. The other case is reported by Dr. Robert Proust, who gives a very full account of the steps by which he extracted a pistol bullet from the pericardial sac of a boy of 13. In this case there had been a good deal of hæmorrhage into the sac, and when the bullet was removed it came away embedded in a clot the size of the fist. The bleeding point was found on the front of the heart, near the apex and towards the left border. This was secured and the hæmorrhage checked, but drainage was inevitable. The small rubber drain that was used proved ineffective, and had to be removed on the thirteenth day after operation, this affording the patient much relief, since it allowed the contents of the sac to escape. The patient made a good recovery, and now, four years later, he is able to work. Examination with the X rays and with the electrocardiogram shows little if any trace of the injury, though by the former method it was said there was a relatively translucent area on the front of the heart near the apex which must have corresponded with the site of the scar in the cardiac wall.

"TENNIS ELBOW."

DR. W. P. Coues has published recently an important paper on the condition known as "epicondylitis," or "tennis elbow," which was first described by Bähr in 1900, and has been principally studied on the Continent. It is described as not uncommon in those who take much exercise, particularly lawn-tennis players. But Dr. Coues has found that athletics in which strenuous movements of the arm play an important part are not the only cause of the trouble. The history is usually as follows. Immediately after a stroke, occasionally some hours or days afterwards, pain is felt in the elbow, usually the right, near the external condyle. This pain may be so severe and sudden as to disable the arm temporarily. It is usually increased by extension of the forearm, not so much by flexion, and may be intermittent or constant, returning immediately the exercise is resumed. Examination soon after injury usually shows no marked swelling. Movement of the elbow is not, as a rule, limited, but there may be great pain on forced extension in the neighbourhood of the external condyle. Pronation and supination are, as a rule, painless. On pressure, an exquisitely painful spot is found over the external epicondyle. Here much pain *is felt on full extension of the forearm* and radiates down *to the fingers. The pain is increased* when the *fingers grasp an object.* It is also brought on by such *movements* as reaching a book on a shelf *or putting on the coat.* Sometimes there is a *suggestion of a slight thickening* over the external epicondyle. After a period of weeks or months, *with or without treatment,* the pain gradually disappears and the patient may again take up his *favourite sport,* with, however, possibility *of speedy recurrence* of the trouble. As to the *nature of the lesion,* several views have been *brought forward.* Tears of the fascia or of some *muscle bundle attached* to the epicondyle, as well *as some nerve implication,* have been suspected. *Dr. Coues suggests that* some of the muscles, exerting a powerful pull, tear off their attachments, *perhaps carrying small* pieces of bone with them. If the exercise is repeatedly attempted the process may *recur* in lesser degree, producing some periostitis of the external epicondyle. This may also be kept up by the ordinary movements of the arm. Simple rest of the arm for a short time does not cure the condition. It may become quiescent and the patient think himself cured, but the first stroke of his racket will bring back all his pain and disability. Dr. Coues reports the *following* cases. After half an hour's hard play at lawn tennis a man felt a sharp pain on the outer side of the elbow and forearm on making back-hand strokes, which require a fixed position of the arm half way between pronation and supination, and there was almost complete inability to make such strokes. At the same time fore-hand strokes, requiring simple flexion only, were made with little discomfort. On examination an exquisitely painful spot was found on the epicondyle. The disability and tenderness persisted three months after the injury. It was questionable whether there was not slight thickening of the periosteum over the epicondyle. In another case a left-handed athletic man while playing golf noticed pain in the right elbow immediately after a stroke, with a distinct sensation of something tearing in the neighbourhood of the external epicondyle. The injury was not severe enough to stop the patient's play that summer, but an exquisitely painful spot appeared over the external epicondyle, where flexion and extension of the fingers caused pain. Considerable pain and disability remained for six months, at the end of which the arm was not well. In this, as well as in another case, a skiagram showed a small spicule of bone which appeared to have been torn from the external condyle.

MURMEKIASMOSIS AMPHILAPHES.

UNDER the somewhat imposing name of murmekiasmosis amphilaphes Dr. A. J. Chalmers, director of the Wellcome Research Laboratories, Khartoum, and Dr. J. B. Christopherson, director of the Khartoum and Omdurman Civil Hospitals, describe in a recent number of the *Journal of Tropical Medicine* a very interesting case of a peculiar form of cutaneous wart characterised by an extraordinary facility for growth causing it to spread and to occupy practically the whole of the right side of the face and neck, involving the external auditory meatus, destroying the right eye, and invading the mucous membranes of the mouth, gums, tongue, and throat. As the most important clinical feature of this apparently new human disease is the warty growths, the authors propose to give it the name of murmekiasmosis amphilaphes, using the term "murmekiasmos" employed by Galen to denote "the breaking out of warts on the body," together with the Greek adjective for "spreading," and adding to Galen's word the termination "is" in order to bring it into accord with modern nomenclature. The patient was an Arab youth, aged 16, and it appears that the warts commenced to show themselves on his face not long after birth. Microscopically the points of interest in the warty masses in this case were the presence of numerous cryptococci, and the fact that the cutaneous warts were largely composed of an adenoma derived from sebaceous glands. A case in England somewhat resembling this in certain respects was published in 1912 by Dr. Lilley in the *British Journal of Dermatology* under the title of "Notes on a Case of Nævo-carcinoma (Melanotic) of the Scalp of a Boy aged 19," but upon examination the clinical description in this English instance does not agree with that of the Arab youth in the Soudan. It is, however, possible that the two conditions might perhaps be variations of the same disease—i.e., a warty growth associated with a proliferation derived from the sebaceous glands. Dr. Chalmers and Dr. Christopherson have made a considerable investigation of the literature of the subject without meeting with any reference to any species of cryptococcus associated with warts. In their opinion the cryptococcus found in the Soudan case does not correspond with any of the already named forms, so that taking all the facts of the case into consideration they think they are justified in regarding the organism as a new species, and they propose to call it by the Latinised name of Cryptococcus myrmeciæ, Chalmers and Christopherson, 1914. The warty growths do not appear *per se* to endanger life, but they destroy organs such as the eye, and when they enter the pharynx there is risk of the larynx becoming involved. The only effectual treatment seems to be by means of dissecting operations, leaving large superficial areas to be covered by skin flaps or by skin-grafting. In the early stages, if the diagnosis is established, the condition can easily be cured by operation—that is, before it had extended to the eye or the pharynx. Some time ago some of the warty masses were removed from the face of the Arab youth by operation, and there has been no reappearance of the growths upon the cicatrix. Owing, however, to the dangers involved no removal of the warty masses inside the mouth, on the tongue, or in the pharynx has been attempted.

THE BRITISH PHARMACOPŒIA, 1914.

AT its meeting on July 13th the executive committee of the General Medical Council formally adopted as "The British Pharmacopœia, 1914," the completed draft submitted by the Pharmacopœia Committee. It was resolved that copies in advance of publication should be made accessible to the public for inspection at the offices of the Council in London, Edinburgh, and Dublin on Monday, August 10th, at 10 A.M., and thereafter from 10 A.M. to 4 P.M., and that a copy for review should on the same day be placed in the hands of the editor of each of the medical and pharmaceutical journals on the Registrar's list. The official publication of the new British Pharmacopœia will be made by notice in the *London Gazette* on Friday, Oct. 9th, on which day copies will be on sale by the publishers, Messrs. Constable and Co., Limited, 10, Orange-street, Leicester-square, W.C.

DIGITALIS AND THE BLOOD PRESSURE.

THE view that the medicinal administration of digitalis causes an increased blood pressure has been so long maintained that the later clinical observations opposing it have even yet gained little general acceptance. It has been noted by Dr. F. W. Price that medicinal doses fail to affect blood pressure; Mackenzie agrees with this finding, and the observations of both were carefully and systematically controlled. On the other hand, it is certain that in animals under experimental, and naturally artificial, conditions digitalis does raise the blood pressure. But this is, perhaps, an instance where it is not safe to argue clinically from laboratory data. Dr. Charles H. Lawrence[1] has made some further observations respecting the effect of digitalis upon the blood pressure in a series of 26 cases, in all of which some degree of cardiac decompensation was present. Both the systolic and diastolic pressures were recorded, and the quantity of urine noted. Digipuratum was the preparation given. In only 19 per cent. was any rise of pressure detected; the maximum rise was 30 mm. Hg, and in this case there happened to be an added acute renal infection. On the other hand, 66 per cent. showed a fall of blood pressure and

---

[1] Boston Medical and Surgical Journal, 1914, vol. clxx., p. 37.

15 per cent. showed no change in pressure. The effects of digitalis upon diuresis, too, were not what one has been led to suppose they would be. Diuresis is associated with fall of blood pressure, not the reverse. This is shown by the fact that where a rise of pressure was noted no cases showed diuresis; where the pressure fell, 88 per cent. showed a diuresis. Upon the diastolic pressure digitalis exerts a similar but less marked effect to that upon systolic. The changes are of less amplitude, and consequently there is a lessened pulse pressure (i.e., difference between systolic and diastolic pressures). The practical conclusions of these observations go to suggest that the fear of this drug's bad effects in cases of high tension, angina pectoris, or arterio-sclerosis, owing to its increasing the blood pressure, is unwarranted. Digitalis in such cases may do good since it rarely causes a rise of pressure, and frequently, by its reverse effect, appears to procure a considerable diuresis. Especially when there is some cardiac decompensation is its administration to be recommended.

Dr. Frederick Taylor, consulting physician to Guy's Hospital, has been elected President of the Royal Society of Medicine for the ensuing year.

Sir William Watson Cheyne, Bart., honorary surgeon to the King and surgeon to King's College Hospital, has been elected President of the Royal College of Surgeons of England.

WE sympathise deeply with the officers of the British Medical Association in having been unable to obtain a favourable answer to their request that the action Stevens *v.* The British Medical Association should stand over for retrial till next sittings. As matters are, the case, which was opened on Wednesday, may still be under hearing in London during the annual meeting of the Association at Aberdeen, a circumstance very embarrassing for all the officers of the Association.

LUNCHEON TO SIR ALEXANDER OGSTON.—As already announced in these columns, arrangements have been made to entertain Sir Alexander Ogston, K.C.V.O., to luncheon by his former house surgeons and dressers on Thursday, July 30th, at the Grand Hotel, Aberdeen. The chair will be taken at 1.30 o'clock by Sir James Porter, K.C.B., late Medical Director-General of the Royal Navy. Those desirous of attending should make application before July 23rd to the joint honorary secretary, Dr. James W. Cook, 26, Manchester-road, Bury, Lancashire.

PRIZE DAY AT GUY'S HOSPITAL.—On July 9th Viscount Goschen presided at the distribution of prizes and medals won by the successful students at Guy's Hospital. Dr. H. C. Cameron, Dean of the Hospital, referring to the Medical School Research Fund started many years ago by a gift of £1000 from the late Mr. Pierpont Morgan, said that it had already borne fruit under the chairmanship of Sir Cooper Perry, with the assistance of several of the heads of departments, in the establishment of a small ward for the study of diseases of nutrition in infancy. The increased accommodation at the school had made it possible to devote more attention to post-graduate students, and in the medical school alone there were now 30 workers, not including the hospital staff engaged in research. Sir George Reid, who presented the prizes, expressed his pleasure at the prominence which was given to research work. The medals awarded were as follows: The Newland-Pedley gold medal for practical dentistry, A. E. Lowein; the Golding-Bird gold medal and scholarship in bacteriology, W. A. Young; the Treasurer's gold medal for clinical medicine, C. de Wet Gibb, and for clinical surgery, C. S. L. Roberts.

ENGLISH MEDICINE AND SURGERY IN THE FOURTEENTH CENTURY.[1]

BY D'ARCY POWER, F.R.C.S. ENG.,
SURGEON TO ST. BARTHOLOMEW'S HOSPITAL, AND FORMERLY PRESIDENT OF THE HARVEIAN SOCIETY OF LONDON.

THE Harveian lecture was established in 1875 to promote the diffusion of exact scientific knowledge, and the office has always been held by one who has done pioneer work in the subject upon which he has lectured. I felt it an especial honour, therefore, when your council not only asked me to lecture, but invited me to choose some topic connected with the history of medicine, a branch of knowledge which had not previously been selected by any lecturer. I accepted the invitation with pleasure, and the more so as it obliged me to carry out a piece of work which I had long been wanting to do and might not otherwise have undertaken.

England in the Fourteenth Century.

I chose "English Medicine and Surgery in the Reign of Edward III." This king was born, as you know, in 1312, came to the throne in 1327, and died in 1377. He lived, therefore, practically through the fourteenth century—a century which closed mediæval history in Europe. It was heir to the wonderful advances in scientific knowledge which marked the twelfth and thirteenth centuries; it immediately preceded the equally wonderful revival in art and literature known to us as the Renascence, a revival which took place at the expense of what is now called "research" and "original work" in favour of art and literature. The men of the fourteenth century were in touch with the older beliefs and traditions, whilst they were endowed with the knowledge of science which had been gained by Roger Bacon and Robert Grosteste. The King of England still flew the Wessex dragon, the old Saxon flag of England when he went to battle, and his wounded men were treated as often by spells and wort-cunning as by clean dressings and primary suture of the bowel.

The fourteenth century is thus worthy of careful study, and nothing in it is more worthy than the practice and the practitioners of medicine. The country was at war with France for 100 years, and the upper and lower classes were as familiar with the Netherlands, France, and Spain as our own men are with South Africa. Trade was active and large sums of money were constantly changing hands. The Black Death, too, in the middle of the century was followed by a long train of epidemic illnesses. All classes of the medical profession profited, and all had abundant opportunity of practising their calling, whilst foreign victories by raising the national blood pressure made them sanguine enough to experiment and advance upon the older methods. The younger generation, too, proved receptive. It watched the results of its teachers and was ready to adopt all means which had proved successful. Surgery, perhaps more than medicine, was in a fair way of becoming a science; then suddenly came the Wars of the Roses, chaos, and all was lost for very many years.

John Arderne.

The fourteenth century was an era of really great surgeons throughout Europe. Lanfrank, the most distinguished pupil of William de Salicet, died in 1306; Henri de Mondeville lived from 1260 until 1320; Gui de Chauliac, prince of the mediæval writers on surgery, died in 1368; Jan Yperman, the Flemish surgeon, died in 1350. These great surgeons were foreigners. We had in England at least one original surgeon—John Arderne—worthy to be classed with them. (Fig. 1.) Born in 1307 he practised for many years at Newark, then a centre for England and a meeting place for Parliament. He came to London in his old age and died at the end of the century. Typical of the fourteenth century he was skilful in leechcraft, a believer in spells, as befitted one brought up in the older school of thought, and yet a skilful and original surgeon, owing no allegiance to authority, profiting by his experience, able to invent wholly new operations. I desire to speak of him for a short time because the kindness of Mr. Henry S. Wellcome and of Mr. C. J. S. Thompson enables me to show you a manuscript of his works which has not hitherto been thoroughly examined.

---

[1] The Harveian lecture, delivered before the Harveian Society of London.

Manuscript of Works of Arderne.

The original manuscript is in the Royal Library at Stockholm. It is said to have been bought in London in 1759 for the sum of £15 by the Swedish Minister at St. James's, and it was presented by him to the king on his return home.

The manuscript (Fig. 2) is a roll of eight skins of vellum sewn together. It measures 17 ft. 8 in. in length by 15 in. The writing is arranged in two and sometimes in three columns which are separated by coloured figures illustrating the text. It is written in an early fifteenth century hand, and there is no reason to doubt the information added later that it was made in the year 1412. The roll has been exposed to considerable vicissitudes during the 502 years it has been in existence, and parts of it are quite illegible. I am, however, very greatly indebted to Mr. Eric Millar, of the Manuscript Department at the British Museum, for the great pains he has taken in transcribing all that can still be deciphered. It is clear from this transcript that the roll is a Latin version of a part of the works of John Arderne made a few years after his death by a copyist who had some knowledge of the "Lilium Medicinae" written by Bernard Gordon in 1305. It is, in fact, what the publishers would now call a revised edition of the works of the late Master John Arderne with additions. Like so many revised editions it is completely spoilt. It has lost its savour. Many additions have been made which Master Arderne would have resented, whilst much is omitted upon which he justly prided himself. Fortunately so many manuscripts of Arderne's works still remain—I have myself seen about 60—that we need not be troubled because this one has been edited.

Contents of the Manuscript.

I do not propose to weary you with a detailed account of the roll, and I will only give a few short extracts that you may be able to gain some idea of its nature and contents. The work is an abstract of Arderne's "Liber Receptarum" arranged in the same order as the corresponding chapters in Bernard Gordon's "Lilium Medicinae," which at the time was the ordinary manual of surgery throughout Europe; it cannot be called the text-book of surgery because it circulated in manuscript, as printing was not yet known. Arderne's roll deals with diseases of the head, throat, eye, ear, chest, lungs, digestive organs, liver, spleen, kidneys, and male organs of generation. There is a section on gout, details of cases treated by the author, and some midwifery. Like all Arderne's works it is remarkable in containing no account of fractures and dislocations, and its early character is shown by the very slight reference made to astrology. The religious character of the age is well shown in the short prayer to be said before giving any medicine. It runs—I give you merely the translation—"O Lord, who marvellously madest man and more marvellously reformed him, who hast given physic to regulate the health of men's bodies, pour down from heaven thy blessing upon this remedy or electuary or draught, &c., that into whosoever's body it shall enter they may be worthy to receive strength of mind and of body through Christ our Lord. Amen."

A single example will show the use made of charms or spells. It is recommended in epilepsy that the words Jasper, Melchior, and Balthazar be written with blood drawn from the auricular or little finger of the patient. The paper bearing the words should be worn by the patient, who was to say daily for a month three Pater Nosters and three Ave Marias for the souls of the fathers and mothers of these three kings. He was also to drink the juice of peony in beer or wine for a month. There is no doubt that Arderne had to treat the equivalent of panel patients, for he says, in speaking of constipation, "Let the man drink 'de brodio,'" which was the equivalent of beef-tea, "if he be rich, but if he is a pauper he may just drink his own urine."

These, however, are mere sidelights, for the manuscript contains a record of valuable experience. Arderne says that the following are fatal signs in quinsy: "If the patient foams at the mouth, if the corners of the eyes become black or green, if the pulse cannot be felt, if the extremities become cold, and if a cold stinking sweat exudes from the armpits; because in these cases the patient will die on the same day." He adds in another manuscript that he had treated very many cases of sore throat where the patient died suffocated in three or four days, so that he had probably seen some unrecorded epidemic of diphtheria.

Arderne's Skill as a Surgeon.

The following case shows his surgical ability in a case of stone impacted in the urethra. He says:—

> I saw a young man with a stone as big as a bean so lodged in his penis that it could not escape through its eye, neither could it be pushed back, but it remained in the middle of the organ as it is here shown. I cured him easily with an incision, for I put him on his back and tied his member with linen threads on each side of the stone to prevent it shifting, and after making a small cut with a lancet over the stone I squeezed it out. I then sutured the skin with a needle and thread over the hole, and dressed it with white of egg and finely ground flour, and having wrapped up the penis in a piece of old and thin linen I let him go in peace for three days. I cut and removed the thread at the next dressing, and in less than a fortnight I had cured him completely. There is no need for alarm in these cases, even though the urine escapes from the wound for three or four days after such an operation, for the patient will certainly be cured.

In like manner his treatment of a case of serious primary hæmorrhage was equally surgical, and was far in advance of his time, for he used cleanliness and sponge pressure when most of his contemporaries would have employed astringent ointments because ligatures and forceps to stop bleeding had not been thought of. Speaking of fistula in ano, Arderne says:—

> I cured a man from Northampton who had three holes in the left buttock and three in his scrotum, as is here shown. The blood escaped very freely after the rectum was divided, because the fistula had tracked deeply. I put a sponge into cold water and stopped the bleeding with it. I then stuffed a good-sized sponge into the bowel and made him sit on a chair. The bleeding stopped directly, and as soon as the patient had eaten a meal and had been put to bed he slept well all night without any farther hæmorrhage.

Another manuscript gives the name of this patient as John Colyer, mayor of Northampton, and the records of the city show that he was mayor in 1327, and again in 1339–40.

The roll also contains a very interesting section on midwifery which is well worthy of more careful study. It gives a series of "birth figures" like those found in Rösslin's "Byrth of Mankind." Each figure is accompanied by a short description which in many instances takes the form of question and answer, as if it had been designed for the oral instruction of midwives. The usual formula runs:—

> Quartus partus est si ambas manus foras ei invenerit. Quid facere debet obstetrix? duobus humeris ejus manus suas ex utraque infigens retrorsum eum revocet, sicut superius dixi, manibus compositum et apprehenso capite paulatim et leviter eum adducat. Si infans caput habet et si duas manus ejicit, oportet obstetricem prius missa manu sua caput ad orificium corrigere et comprehensis manibus infantis conari debet ne caput orificium vulve non obstipet, sed facillime omne corpus infantis exire possit quo priores manus exierant.
>
> (The fourth birth or position is when both hands present. What should the midwife do? Grasping the hands with the arms on either side let her push back the child arranged with its hands as I have said above, and having seized the head, let her draw it down slowly and gently, &c.)

And so I could go on with extracts for a long time, but as it would be at the risk of wearying you I shall pass on to more general matters.

Medical Practitioners in the Fourteenth Century.

The treatment of the sick in England during the fourteenth century was in the hands of the same classes of practitioner as it is at the present time. It was shared by the physician, the surgeon, the family medical attendant, and the quack. The apothecary, then as now, was a tradesman. In country places the ladies did what they could to relieve the illnesses of their poorer neighbours.

The English Mediæval Physician.

The physician was usually, but not necessarily, a churchman. He learnt abstract science in the monastery schools and the scientific side of medicine in a university. He then returned to his monastery, where he either remained as physician or received preferment, becoming attached to the household of some great man. Dr. Norman Moore[2] gives the names of eight physicians practising in or near London during the reign of Henry III. (1216–72). Two were physicians to the Queen—it is not stated whether or not they were in orders; two were canons of St. Paul's. Two were priests resident at St. Alban's, and it is to be noted that one of these priests was the son of "Adam the Physician," who was not therefore a priest. The last of the eight was a doctor of medicine, a doctor of laws, and a doctor of theology, a professor at Paris and Oxford, physician to the King of France and to the Bishop of Lincoln.

We know that no great change had taken place in the status of the English physician in the next hundred years, because John of Gaunt had two physicians in his retinue, John Bray and William Appulton. John Bray was John the Minorite, "Johannes de ordine Minorum, in armis bellicis strenuus, in physicâ peritissimus, domino Johanni duci Lancastriae familiarissimus" ("John of the order of the Minorites, courageous in war, most skilful in physic, most acceptable to My Lord, John Duke of Lancaster"). It was precisely because he was such a friend of the duke that the London mob beheaded him on Tower Hill after the Savoy was burnt in 1381. His colleague was Frère William de Appulton, "physician and surgeon," who received xl marks in time of peace from the honour of Pomfret; in war time other xl marks and ranked as a gentleman, clerk, esquire, or a chamberlain, having four horses and two grooms allotted to him. Bray had received £10 a year, with 3s. a day travelling allowance. He ranked as a chamberlain with an allowance of two horses and the wage of one groom.

The physicians attached to John of Gaunt, therefore, held a good position in his household. They were men of affairs and took an active part in counsels of war. It is clear from the description of Frère William that he was prepared to act as a physician or as a surgeon,[3] so that the line of division between the two branches of the profession was not so absolute as is usually described. The popular idea of a physician as he is represented in Fig. 3 was generally accurate. He was a learned man who taught pupils, gave advice, prescribed drugs, and ordered active treatment when he considered it necessary. In this particular case[4] the physician is represented in an ecclesiastical dress with a biretta (Fig. 3). He is watching a patient who has been ordered to take a dose of medicine. The stool with the basin beneath it shows the primitive sanitary arrangements of the time. It was not even a close stool, the first mention of which is in 1410, or more than 50 years after the time we are considering.

My friend Dr. H. P. Cholmeley has recently issued an admirable account of the English mediæval physician in his book on John of Gaddesden, who lived from 1280 to 1361, and as the book is easily accessible I need say no more about him except that on the two occasions when Arderne, his contemporary, refers to him it is in connexion with the diseases of women, so that he was evidently held in estimation as a gynæcologist.

The Operating Surgeon.

The operating surgeon—as a class—was in a lower position than the physician, and during the fourteenth century he was in a transition state. He was still itinerant because he went from house to house to do his cure—that is to say, he undertook for a certain fee to operate and attend the patient until he was well. This involved personal service, occasionally for long periods of time, and the fees charged were relatively large because it was impossible to have more than one case in hand at a time. The fee was paid partly in cash, partly in kind, and partly in the form of an annuity which the surgeon received so long as the patient lived. The operating surgeon travelled extensively, lived with the moneyed classes, and if he was a good fellow was received by his patients on a friendly footing. He also gained a large income.

Most of the operating surgeons in this century had seen war service, I imagine, and although there were a few in the provincial towns, the majority congregated in London where they became members of the Guild or Fraternity of Surgeons. Membership of this Guild gave them the right to call themselves "Master" or "Magister" with a special cap and robe, as seen in the picture (FIG. 1), and for a few years they arrogated to themselves the prefix "de," so that John Arderne when he was elected into the Guild became Magister Johannes de Arderne. Many operating surgeons had taken orders and were consequently unmarried, but they do not seem to have held Church preferment, as was the case with physicians. The attitude of mind of the lay surgeons was, however, sincerely religious when they belonged to the better class, and their religion was certainly not a pose. Arderne, writing in 1376, used to say, "I did my cure to him and the Lord being mene (Deo favente) he was helid perfectly," in exactly the same humble-minded spirit as Ambroise Paré—200 years later—said, "I dressed him, God cured him."

The Master Surgeons as a guild exercised control over the practice of surgery in London. Isolated notices of them occur as early as 1312, and the record of 1354 shows definitely the use to which the authorities put their knowledge. It says:—

> Be it remembered that on Monday next after the feast of St. Matthias the Apostle (24th Feb. N.S.) in the 28th year of the reign of King Edward iiird, the Prior of Hogges, Master Paschal, Master Adam de la Poleterie, and Master David de Westmerland, surgeons, were sworn before the Mayor, Aldermen and Sheriffs, to certify them as to a certain enormous and horrible hurt on the right side of the jaw of Thomas de Shene; whether or not such injury was curable at the time when John le Spicer of Cornhulle took the same Thomas under his care to heal the wound aforesaid. Who say upon their oath, that if the aforesaid John le Spicer at the time when he took the said Thomas under his care had been expert in his craft or art or had called in counsel and assistance to his aid, he might have cured the injury aforesaid; and they farther say that, through want of skill on the part of the aforesaid John le Spicer the said injury under his care has become apparently incurable.

I am inclined to think that John le Spicer was an apothecary seeking to practise surgery and that he was a member of the Fraternity of Spicerers.

The duties of the officers of the Guild had become stereotyped into an oath as early as 1369, but I quote the oath of 1390 because it states that women as well as men practised surgery in the City of London. It runs:—

> On Monday, 10th April in the thirteenth year of King Richard the Second Master John Hynstock, Master Geoffrey Grace, Master John Bradmore and Master Henry Suttone, surgeons were admitted in the Court of Guildhall in London before William Venour, Mayor, and the Aldermen. They were sworn as Masters Surgical of the aforesaid city well and truly to serve the people in working their cures, taking of them reasonable recompence, &c. To practise truly their trade and to make faithful oversight of all others both men and women, occupied in cures or using the art of surgery, presenting their lack both in practice and medicine so often as needs be to the aforesaid Mayor and Aldermen. They shall be ready when warned thereto to take charge of the hurt or wounded and to give faithful information to the servants of the City of such hurt or wounded as are in danger of death or not.

The Master Surgeons themselves were held in some estimation and consorted on fairly equal terms with the physicians, but the reputation of operating surgeons as a whole was not good. Their wandering life very often made them literally vagrants, and if a case was not doing well they had an unpleasant habit of slipping away and leaving the patient to Providence. In the popular estimation they were drunken, lascivious, boastful, and quarrelsome thieves. William de Salicet, writing for surgeons at the end of the thirteenth century, says gravely enough that a wise surgeon will refrain from stealing whilst he is actually in attendance upon a patient, and that he should not employ assistants with notoriously bad characters, not because it is morally wrong, but because such actions are likely to prejudice the patient against his surgeon and so spoil an otherwise good operation.

The best of the operating surgeons, however, did good work in the fourteenth century, and they almost succeeded in making surgery a profession. Their skill and boldness may be judged from this extract from the manuscript of an unknown surgeon whose work still lies unprinted at the British Museum.[5] The section treats "of wounds of the gut and liver.' It says:—

> Yf a gutte passe out of the wounde and it be not wounded reduce him in again, and yf you may not reduce him procede in this manner. ffirst chaufe ye guttes that ben oute and mollifie hem with a gret sponge (wetted) in water of ye decoccion of camomulle & anys & enoynte hem with hoote oile of camomulle & when they be chaufed with the aforeseid sponge putte hem in agen as well as you may & yff you may not reduce hem by this weye open ze wound a litell more liztly & widely & then reduce hem & sewe ye wounde & yf the gutte that passe out be wounded then that wounde ben dedlye but yet leve not the resonable cure of the wound.
>
> An ye guttes be kutte all otmest so that ther leve nothyng hoole thane natheless the wound is mortal and may not receive no curacion; but yf ze guttes be kutte on lengthe other in partie on breadth but not fully cut in sonder hardily conduce ye parties of ye gutte that is kutte, whether that it be kutte ye lengthe other brede, & sewe hem in ye manner as skynners sewen ther furroures [furs], for in this case it is ye best maner; & anone as it is sewed lay on a poudir that mo cleve together to the guttes & the sewing the weche is made in this manner: Take Mastic, draganth & gum arabick, &c.

In the same manner it is recommended that a ruptured liver should be treated by suture.

The Barbers.

The term "leech" was used familiarly as the term "doctor" is at present, and was applied to all members of the medical profession. The general or family practitioner, at any rate in London, was obliged to be a member of the guild or fraternity of Barbers. He was a Barber and was called a Barber or, at the best, a Barber practising surgery, for there were no Barber Surgeons, since the Barbers and Surgeons did not unite until 1540. Some jealousy existed between the operating surgeon and the barber who practised surgery, for Arderne says, in speaking of the treatment of thrombosed piles by incision: "And be the lech ware that non of tham that standeth ny about perceive when he openeth the lancet for if barbours know this doing they would usurp this cure, appropriating it to themselves unto unworschip and no little harm of the Master (surgeons)." It is clear, too, that the barbers held a somewhat lower position, for it is told of a fishmonger, who spiked his arm on the swingdoor of the Carmelite Church in Whitefriars, that "he was almost dead what with the aching, swelling, burning and improper treatment of a barber that put into the wound irritating tents of linen and had covered them with diachylon. All thes dressings I took away and about evensong replaced them with a simple dressing of oil. And before cockcrow the patient was relieved and in the morning he slept well and I cured him finally and thereby I got much honour."

---

[5] Gallen's Boke of Operacion, Sloane MS. [illegible], F. 1. [illegible]

Here is a case showing the ordinary course of surgical routine and the relationship between women, barbers, and surgeons in the fourteenth century. The priest had a cancer of his breast. John Arderne tells the story in one of his minor works. He says:—

> To a preest of Colstone faste by Bynghuame (Colston Bassett in Notts) ther felle a sore in the ryghte pappe withinne the skyne uppone the heed of the pappe as it were a litill knotte & in manner of a pese with ycchynge & so the forseyd knotte bi contynywaunse grew foorth tyll it was of the gretnesse of ane henne egge & that it came to the foorme & lyknesse of a topp. The colour of this sore was lyvyd medlyd with rednesse & waterynesse & hard in felynge & whane ii yere were passyd he was tawghte of a lady to leye ane emplastre therto & to drynke of the drynke of Antioche and whane he perceyved that the forseyde medicines prevayled hyme nowgth he went uneto the towne of Notynghuame to be leten blood & whane the barbour perceyved the forseyd knotte he asked of hyme whether that he wolde be holpen therof & tolde hyme that he hadde a cure therfore & coowde hele hyme therof. The preest seyd he wolde fayne be holpen but nevertheless he seyde to him he wolde aske counsell yf it myghte be done as he seyd unto him. And in the same towne ther was a wyse sirurgyane of the weche the seyd preest hadde wetynge & wente to hyme to aske counsell yf that he were curable or if that he myghte suffre ony kuttynge or corrosyne or ony suche other medicines. And the seyde leche warned him that he schulde in no manere wyse putte no corrosyve ne non other violent medicines ne lete no kuttynges come ther-ny for yf he dyde he promysed that yt wolde brynge hyme to the deeth withouten ony rekevere.

The barbers acted in their public capacity as health officers of the City of London. They had charge of the gates of the City and were formally appointed gatekeepers. They knew who came in and who went out, and their medical knowledge enabled them to segregate the lepers who were so fruitful a source of anxiety to every community throughout the Middle Ages. The barbers also had the superintendence of the Bagnios, which were little else than licensed brothels, and it is for this reason that in 1308 Richard the Barber, on his presentation to the Court of Aldermen as Supervisor of the Barbers, made "oath that every month he would make scrutiny throughout the whole of his trade and if he should find any among them keeping brothels or acting unseemly in any way and to the scandal of the trade he was to distrain upon them."

These duties interfered to a certain extent with the duties required of every citizen—the serving on juries and keeping of watch and ward. Both were irksome, and the early records of the Barbers are full of attempts to gain exemption. The City watch was especially onerous, for in times of unrest, and they were frequent throughout the thirteenth and fourteenth centuries, the streets of London were patrolled at night by a guard which the chroniclers tell us was as many as 10,000 men armed and grouped into bands under the different aldermen. In ordinary times a dozen men from each ward sufficed, but they had to be properly armed and accoutred so that they were a source of continual expense. The barbers obtained exemption both from serving on juries and from watch and ward, and the exemption, as you know, still holds good for us so long as we are in the actual practice of our profession.

The barbers took no responsibility with their patients. Every person under their care who was "in danger of death or maim"—that is to say, who was seriously ill or likely to suffer from permanent disablement—had to be seen by the Master or Wardens of the Barbers' Guild within three days of the first attendance. Any barber who neglected this rule of "the presentation" of patients was fined and might be imprisoned, whereas if he obeyed it he was held blameless—except in very gross cases of malpraxis—whatever happened. The rule worked well, and for 300 or 400 years there is no record of the attending barber being supplanted by the Master and Wardens whom he had called in to assist him. The women members of the Barbers' Guild and Company did not exercise their art and mystery, but were the wives, widows, and daughters of members who kept on the apprentices or received what would now be called a pension.

Subordinate Grades.

In the subordinate ranks of the profession were many different grades. They chiefly flourished in country places and travelled from town to town. The dentist, as is seen in Fig. 4, was known by the belt which he carried to display the number of successful extractions he had performed, but it is evident that his tools were of the rudest, even if allowance be made for inaccurate drawing. The coucher for cataract, the cutter for stone, and the curer of ruptures were well recognised itinerant occupations, whilst cupping, or "garsing" as it was called, was left to a special class, of whom the last survivor disappeared from the Blackfriars-road well within our own recollection. It seems, however, that only the operative part was left to these practitioners, for the surgical manuals of the time deal with the treatment of diseases of the eye, with the signs and symptoms of stone in the bladder and kidneys, as well as with hernia. The method of leeching seems to have been simple if Fig. 5 may be trusted, for the patient is sitting with her feet in the pond until the leeches fasten upon her legs.

Bathing in like manner was reduced to its simplest form, as is here shown. (Fig. 6.)

The Apothecary.

Very little is known of the apothecary in the fourteenth century. He practised a separate trade in London as a member of the Spicers' Guild—for the Guild of Grocers was not yet formed—and in all probability he was an offshoot of the confectioners. The Ward Robe Rolls show him as a court official who in the reign of Edward II., in 1313, received 7½*d.* a day. His name was Odin the Spicer, and when Madame the Queen was ill at Westminster in the November of that year, he bought things for her. He is called definitely "Odinus Apothecarius Reginae." In 1345 Coursus de Gangeland, an apothecary of London, was granted 6*d.* a day by Edward III. for taking care of and attending his majesty during his illness in Scotland, so that by this time he was definitely engaged in medical practice. In 1360 Peter of Montpellier was apothecary to Edward III., and Freind says in his History of Physic (vol. ii., p. 292) that J. Falcand de Luca in 1357 was the first apothecary to sell medicines in England.

The apothecary held a well recognised position as the "physician's cook," and Chaucer says in his prologue, when speaking of a Doctour of Phisike:—

> Ful redy hadde he his apothecaries,
> To send him drugges, and his letuaries,
> For ech of hem made other for to winne;
> Her frendship was not newe to begynne.

John Arderne makes several references to "the potecary." Writing in 1372–6 he says: "Euforbium is a gumme that potecaryes sellen," and in another place: "Agryppa is ane oyntment that potecaryes sellen, and it is whyte of coloure"; and yet again: "Thou mayest put to a wounde common unguentum album that apothecaries make."

The spicers and the pepperers were nearly all Italians in the fourteenth century, and the apothecary was necessarily a member of one of these guilds, or he could not ply his trade. There is a curious passage in one of Arderne's works which shows that these Italians were already assuming to themselves certain humble medical duties, for he says in speaking of clysters and their uses, "I have gotten an hundred times gret honour with lucre in diverse places. ffor why, at London when Lumbardez oft-times ministered clisteries on their manner to colic men and other men constipate, ne might not availe, I forsooth, with the aforesaid manner of clystering at the first time within the space of a forlong or two I delivered the patient for certayne, our Lord being mene." The passage is interesting apart from the reference to the Lombards as specialists in the administration of enemata, because it shows how prevalent constipation must have been when living was high, people were sedentary, and purgatives were few. The estimation of the action of clysters in terms of distance rather than of time seems to be wholly original. So far as I remember, however, the apothecaries never came into serious conflict with the surgeons or with the barbers of London in the exercise of their occupation. They were soon merged into the great Company of Grocers and developed into ordinary shopkeepers as retail sellers of drugs and spices. It was only when they were formed into a separate body as the Society of Apothecaries that they became a thorn in the side of the physicians, but this was more than 250 years later.

The Hospitals.

The hospitals in the fourteenth century formed a special branch of charitable work, just as they do at the present time. In London they had already existed for nearly 200 years. They were religious institutions nursed by members of the Augustinian order, and provided food, rest, nursing, and religious consolation for those who were acutely ill. There was no separate medical or surgical staff until the sixteenth century, and we have no knowledge as to the nature of the treatment followed. The patients were sick persons found in the streets of the City and all the wounded or injured who chose to apply for relief. Everyone was received freely and without question. Special servants of the hospital—the beadles—clothed in a distinctive livery and wearing a badge, were appointed to bring patients into the hospital. At St. Bartholomew's Hospital they still exist, and their sixteenth century charge ran:—

> Ye shall separate and divide yourselves into sundry parts of the city and the liberties thereof, every man taking his several walk. And if in any of your walks ye shall happen to espy any person infected with any lothely grief or disease, which shall fortune to lie in any notable place in the City to the noyance and infection of the passers by and slander of this house ye shall then give knowledge thereof unto the Almoners of this hospital that they may take such order as to them shall be thought meet.

We also know how such patients were received, for the order runs:—

> When the patient arrives he shall be received thus: First, having confessed his sins to the priest he shall be communicated religiously and afterwards be carried to bed and treated there as Our Lord, according to the resources of the house; each day before the repast of the brethren he shall be given food with charity, and each Sunday the epistle and the gospel shall be read with aspersion.

The patient was looked upon as the direct repreesntative of Christ, and was spoken of as Master or Lord, "Domini nostri pauperes," "Les Signors malades," "Our Lords the Sick," a very different form of address from the brutal terms of the eighteenth century, when they were spoken of officially as "the miserable objects."

The hospital consisted of a large hall (Fig. 7) ornamented with a high-pitched roof, a central louvre, beds in rows down the sides and in the centre, rather overcrowded to our ideas, with an altar raised a few steps at one end so that the patients could see the celebrant. The beds clean and neat, for there is a special order that they should be of sufficient breadth and length, and that the coverlets and sheets should be clean, separated perhaps by curtains, occupied certainly by two patients. This, however, was no hardship, because the proverb that "Travel makes us acquainted with strange bedfellows" is a remembrance of the time when it was usual for a person to share his bed with a stranger, and readers of literature even as late as the eighteenth century will recall many instances where the hero or the heroine has suffered loss at the inn where they have slept with a stranger who rose early and took the purse or the clothes of the heavier sleeper. Indeed, Sir Sidney Waterlow used to tell us when we were house surgeons and complained of the inadequacy of the accommodation offered us by the hospital, that when he was an apprentice he shared his bed with two others and that he slept *in the middle* because he was the smallest. The use of wooden bedsteads which was universal at the time made the bugcatcher an important and useful person at every hospital. The services of the Church compelled the constant attendance of the religious by night as well as by day, and the sick were therefore never left without supervision.

The *food* was as good as could be obtained and seems to have been liberally supplied, whilst extras were allowed on a somewhat lavish scale. Of the food and the extras these two stories have come down to us. The first was a miracle wrought by Alfun, the builder of St. Giles, Cripplegate, whom Rahere, the founder of St. Bartholomew's Hospital, had associated with himself when he felt age creeping on.

> It was the manner and custom of this Alfun [says the narrator] with servants of the church to compass and go

> about the nigh places of the church busily to seek and provide necessaries to the need of poor men that lay in the hospital and what was committed to him truly to bring home and to sundry men as it was need to divide. And there was a certain butcher Goderyke by name, a man of great sharpness and he was a mean man, the which not only to the asker would not give but was wont with scorning words to insult them. It fell upon a certain day that Alfun went about the butchers man by man and after other when he came to this Goderyke and moved him after the apostle with good and honest words importunately, because he was not willing to give, and when the old man beheld that not for dread, neither for love of God nor also for shame he might not temper the hardness of that indurate heart he broke out in these words, "O thou ungentle and unkind man! I beseech thee wretch put away a little and swage the hardness of that unfaithful soul and take in experience the vertue of the glorious apostle, in whom if thou trust I promise thee that every piece of thy meat that thou givest me a portion of shall the sooner be sold to other and nothing to the minishing or lessening of the price." He, not moved with the instinct or inward stirring of charity but overcome with the importunity of the asker, drew out a piece of the vilest and cast it into his vessell calling them truants and bade them lightly go from him; to whom Alfun answered "I shall not go from thee, till my word and promise be fulfilled." And without tarrying there was a citizen coveting to buy flesh for him and his household and of that heap of the which Alfun spoke before he bought at the will of the seller and bare it with him. And when this was divulged through all the butchery it was taken for a worthy miracle. And from that time they began to be more prompt to give their alms and also fervent in devotion.

The story is a pretty one, and is so graphically told that one has no doubt of its truth. The old priest, with the hospital servants behind him carrying a large wooden begging bowl, going from stall to stall in the meat market; the surly butcher, with the rest of the market looking on to see how Alfun would fare, the twinkle in the old man's eye as he knew that he had bested him; and the breathless citizen, who wanted to buy the worst meat at the highest price, bring back the whole scene and makes one wonder whether a part of it had not been rehearsed by Rahere and Alfun, who must have retained some sparks of that spirit which in youth had made them court favourites.

The story about the "extras" is told of the Knights Hospitalers of St. John of Jerusalem. It is said that Saladin desiring to prove for himself the indulgence of the knights to their patients disguised himself as a pilgrim and was received among the sick at the hospital in Jerusalem. He refused all food, declaring there was only one thing he fancied, and that he knew they would not give him. On being pressed, he confessed that it was one of the feet of the Grand Master's horse. The Grand Master was told, and at once ordered the noble animal to be killed and the sick stranger's desire satisfied. But Saladin thinking the experiment had gone far enough declared himself taken with a repugnance to meat, and the animal was spared.

Conclusion.

And thus ends a very short account of an interesting period of medicine in England. It is impossible in the scope of a single lecture to give more than a bare outline of the subject, but it has been my intention to show that there was a blending of the old and new during the fourteenth century. Wort-cunning, which still lingers amongst us at the herbalists, was the older Saxon leechcraft; spells were a reminiscence of the Danish rule; classical medicine was coming into vogue through the Arabic translations, and was brought to England from the schools of Salernum and Montpellier. Side by side with this knowledge, altering, modifying, and even creating, was the sturdy originality of the English mind. I shall have effected a part of my purpose this evening if this lecture induces some of you to go to the British Museum, to the university libraries, and to the cathedral libraries in search of the writings of our early predecessors which have escaped destruction but have never yet been printed. Such writings I believe to be numerous—some in Latin, some in racy translations, some in the original English in which they were written.

ROYAL COLLEGE OF SURGEONS OF ENGLAND.

A QUARTERLY meeting of the Council was held on June 9th, Sir RICKMAN GODLEE, the PRESIDENT, being in the chair.

The PRESIDENT reported the result of the recent election of five members of Council, which was published last week in THE LANCET, and he further stated that Mr. Stanley Boyd being fourth on the poll became substitute member of Council for Mr. R. Clement Lucas until 1917, and that Mr. Charles Ryall being fifth on the poll became substitute member of Council for Mr. Jonathan Hutchinson until 1915.

Mr. Ballance, Mr. Boyd, Mr. Thorburn, Mr. Eccles, and Mr. Ryall were introduced, made declarations in the terms of the oath prescribed by the Charter of 1800, and took their seats in the Council.

It was resolved—

> That the Council desire to express to Mr. William Pearson, upon his retirement from the post of prosector, their high appreciation of his services to the College during a period of 58 years. The Council believe that the many preparations added to the Museum as the result of his work are justly counted amongst the most treasured possessions of the College and that they will stand as a lasting record of his exceptional skill and industry.

The PRESIDENT reported that the following demonstrations would be given at the College in connexion with the Fifth Annual Session of the Clinical Congress of Surgeons of North America:—July 27th, 11.30 A.M., Professor A. Keith: The Nature of Peritoneal Adhesions; 28th, 11.30 A.M., Mr. Shattock: Specimens illustrating the Growth of Tumours; 29th, 11.30 A.M., Sir Rickman Godlee: Hunterian and Listerian specimens; 30th, 11.30 A.M., Professor Keith: Hunter's specimens illustrating Growth of Bone; 31st, 11.30 A.M., Mr. Colyer: Specimens from the Odontological Collection illustrating General Surgery; and at 5 P.M., Mr. A. H. Cheatle: The Surgical Anatomy of the Temporal Bone.

The PRESIDENT also stated that a reception would be held in the College from 4 to 6 in the afternoon of Wednesday, July 29th.

Election of President.

Sir William Watson Cheyne was elected President and Sir Frederic Eve and Sir Anthony Bowlby were elected Vice-Presidents.

The following appointments were made:—Erasmus Wilson Lecturer: Mr. S. G. Shattock. Arnott Demonstrator: Professor Keith. Hunterian Professors: Arthur Keith (six lectures), Rupert Farrant (two lectures), William Sampson Handley (one lecture), John Howell Evans (one lecture), Frederick Charles Pybus (one lecture), and Harry Blakeway (one lecture). Arris and Gale Lecturers: Frederick Wood Jones (one lecture) and David Waterston (two lectures). Mr. J. F. Colyer was elected to give two odontological demonstrations.

Sir Rickman Godlee was elected a member of the Executive Committee of the Imperial Cancer Research Fund.

DONATIONS AND BEQUESTS.—The Royal Dental Hospital of London has received a grant of £1000 from the executors of the late Sir William Dunn, being part of the residue of his estate.—Mr. William Hartmann has sent a donation of £1000 to the trustees of the Lord Mayor Treloar Cripples' Hospital and College for a "Meta Hartmann Cot" in the hospital at Alton.

ROYAL COMMISSION ON VENEREAL DISEASES.

AT the forty-fourth meeting of the Royal Commission evidence was given by Mr. J. E. R. Macdonagh, one of the surgeons of the Lock Hospital and by Mr. C. A. Parker, representing the State Medical Service Association.

Mr. Macdonagh said that at the present time the education of medical students in regard to venereal disease was quite inadequate, and it was very important in his opinion that compulsory clinical education of students in venereal disease should be adopted. He considered that widespread clinical experience would render public laboratories for the carrying out of bacteriological and other methods of diagnosing syphilis superfluous. The important thing in dealing with syphilis was to treat cases at the earliest possible moment, and these early cases could be diagnosed with greater certainty by clinical than by pathological methods. A negative Wassermann reaction in early syphilis did not exclude the disease, and if treatment were deferred until the reaction became positive the golden opportunity of cure was lost, however energetic the treatment might be. Syphilitic sores, moreover, frequently existed in which spirochætæ could not be found. Mr. Macdonagh was of opinion that syphilitic nervous lesions were steadily on the increase, and he considered that the spasmodic administration of salvarsan commonly practised in this country was likely to lead to a further increase. This spasmodic administration of the drug, moreover, gave a false sense of security and therefore rendered patients a greater danger to the community. He advocated that the Lock Hospital should be enlarged. The number of patients attending the hospital was steadily increasing. Mr. Macdonagh thought that medical research had been very insufficiently supported by the Government, and that much more might be done in this direction; he suggested that it might be an advantage if payment were only made for results.

Mr. Parker maintained that by the establishment of a State Medical Service many difficulties now connected with the treatment of venereal diseases could be overcome. It was essential that treatment should be efficient and confidential and in the last resort compulsory, and that the medical officers of health should be in touch with all cases of venereal disease. Efficient treatment would be procurable for the whole State service and would be open to all sufferers. The treatment would be confidential; there would be no special service of medical practitioners set aside for dealing exclusively with venereal diseases, by consulting whom patients would at once declare to the world at large the nature of their complaint. The size of the State Medical Service, its large and manifold functions, and its large and specialised staffs would render it impossible for the public to suspect the reasons which led the patient to ask advice. The treatment of venereal disease would be but a part of the preventive and curative treatment offered to all sufferers alike under a State Medical Service. No action whatever would be taken on the part of any public authority as long as a patient attended regularly and carried out the instructions of his doctor, but in the event of his failing to do so he would be proceeded against as a public danger in the same way as is done in the case of ordinary infectious diseases. Mr. Parker considered the difficult question of notification would be solved under a State Medical Service. Notification in the sense of a notice sent by a private practitioner to the medical officer of health would become unnecessary for all patients attending a State doctor would be registered with the history and nature of their complaint, and to those persons the medical officer of health, who would represent but another part of the same service, would have daily access. In the event of their being a body of private practitioners outside the service there should be notification of venereal disease either by name or number, and the medical officer of health would satisfy himself that the necessary treatment was being carried out by the patient. If this were not so the name of the patient would be declared, and he would be transferred to the charge of the State Medical Service. In order to obtain reliable statistics as to the fatal results of venereal diseases and their sequelæ it might be advisable to have a dual system of death certification—one for the purposes of the State Medical Department giving the fullest details as to the primary and secondary causes of death, and the other avoiding all facts which might cast a slur on the memory of the dead to be handed to the relatives of the deceased.

At the forty-fifth meeting the headmasters of Eton and Rugby appeared before the Commission. They considered that the ideal was that boys should be instructed in matters relating to sex by their parents, but their experience showed that that method was not likely at the present moment to be successful to the extent that it was desirable. Instruction at school should be given with much caution, and it should be the special responsibility of the headmaster to give it or to see that it was given. A propaganda based solely on hygienic principles would not bring in the chivalrous appeal which was necessary and was not likely to succeed. At the same time hard exercise, hard work, wholesome society, and moderation in diet and drinking were of great use as safeguards against indulgence.

At the same meeting Dr. Santoliquido, formerly Director-General of the Public Health Department in Italy, gave an account of the administrative methods adopted with regard to venereal diseases in that country.

VITAL STATISTICS.

HEALTH OF ENGLISH TOWNS.

IN the 97 English and Welsh towns with populations exceeding 50,000 at the last Census and whose aggregate population at the middle of this year is estimated at 18,120,059 persons, 9091 births and 4000 deaths were registered during the week ended Saturday, July 11th. The annual rate of mortality in these towns, which had been 12·9, 12·1, and 12·7 per 1000 in the three preceding weeks, fell again to 11·5 per 1000 in the week under notice. During the 13 weeks of last quarter the mean annual death-rate in these towns averaged 13·8, against 13·1 per 1000 in London during the same period. Among the several towns the death-rate last week ranged from 2·8 in Eastbourne, 4·3 in Exeter, 4·7 in Hornsey, 6·0 in Enfield, 6·1 in Wimbledon, and 6·2 in Southend-on-Sea, to 16·7 in Warrington, 17·0 in Gateshead and in Tynemouth, 17·6 in Liverpool, and 22·8 in Bootle.

The 4000 deaths from all causes were 421 fewer than the number in the previous week, and included 394 which were referred to the principal epidemic diseases, against 391 and 444 in the two previous weeks. Of these 394 deaths, 139 resulted from measles, 112 from infantile diarrhœal diseases, 77 from whooping-cough, 30 from diphtheria, 22 from scarlet fever, 13 from enteric fever, and 1 from small-pox. The mean annual death-rate from these diseases was equal to 1·1 per 1000, and was 0·2 less than the rate in the previous week. The deaths attributed to measles, which had been 140, 144, and 130 in the three preceding weeks, rose to 139 last week, and caused the highest annual death-rates of 1·4 per 1000 in Sheffield, 1·7 in Rochdale, 1·8 in Liverpool, and 2·1 in Oldham. The fatal cases of whooping-cough, which had been 99, 93, and 95 in the three preceding weeks, fell to 77 last week; the highest death-rates from this disease last week were 1·5 in Birkenhead and 2·1 in Warrington. The deaths from diphtheria, which had been 40, 35, and 64 in the three preceding weeks, fell to 30 last week; the highest death-rate was 2·7 in Great Yarmouth. The fatal cases of diarrhœa and enteritis (among infants under 2 years), which had been 79, 79, and 116 in the three preceding weeks, were 112 last week; and included 21 in London, 10 in Sheffield, 9 in Liverpool, 8 in Birmingham, and 4 each in Birkenhead and Wigan. The deaths from scarlet fever, which had been 24, 30, and 23 in the three preceding weeks, were 22 last week; of these 22 deaths 5 occurred in London. The deaths from enteric fever, which had been 8, 13, and 16 in the three preceding weeks, fell to 13 last week, and included 4 in London and 3 in Portsmouth. The fatal case of small-pox was recorded in Rochdale.

The number of scarlet fever patients under treatment in the London Fever and the Metropolitan Asylums Hospitals, which had steadily increased from 2352 to 3002 in the eight preceding weeks, further rose to 3100 on Saturday last; 414 new cases were admitted during the week, against 406, 440, and 442 in the three preceding weeks. These hospitals also contained on Saturday last 1935 cases of diphtheria, 256 of whooping-cough, 42 of measles, and 13 of enteric fever, but not one of small-pox. The 921 deaths from all causes in London were 227 fewer than the previous number, and corresponded to an annual death-rate of 10·6 per 1000. The deaths referred to diseases of the respiratory system, which had been 103, 141, and 125 in the three preceding weeks, fell to 111 in the week under notice, and were 5 above the number in the corresponding week of last year.

Of the 4000 deaths from all causes in the 97 towns, 193 resulted from different forms of violence and 348 were the subject of coroners' inquests. The causes of 29, or 0·7 per cent., of the total deaths were not certified either by a registered medical practitioner or by a coroner after inquest. All the causes of death were duly certified in London, West Ham, Portsmouth, Bristol, Leicester, Nottingham, Manchester, Salford, Bradford, Leeds, Sheffield, and in 71 other smaller towns. Of the 29 uncertified causes of death, 8 were registered in Birmingham, 4 in Liverpool, and 3 in Stoke-on-Trent.

HEALTH OF SCOTCH TOWNS.

In the 16 largest Scotch towns with an aggregate population estimated at 2,293,200 persons at the middle of this year, 1158 births and 597 deaths were registered during the week ended Saturday, July 11th. The annual rate of mortality in these towns, which had been 14·6, 13·8, and 14·1 per 1000 in the three preceding weeks, fell to 13·6 per 1000 in the week under notice. During the 13 weeks of last quarter the mean annual death-rate in these towns averaged 15·5, against a corresponding rate of 13·8 per 1000 in the 97 large English towns. Among the several towns the death-rate last week ranged from 7·0 in Clydebank, 7·3 in Paisley and Kilmarnock, and 7·8 in Falkirk, to 14·1 in Glasgow, 15·7 in Edinburgh, 16·9 in Dundee, and 22·0 in Ayr.

The 597 deaths from all causes were 24 fewer than the number in the previous week, and included 41 which were referred to the principal epidemic diseases, against 52 and 41 in the two preceding weeks. Of these 41 deaths, 13 resulted from whooping-cough, 10 from measles, 10 from infantile diarrhœal diseases, 3 from scarlet fever, 3 from enteric fever, and 2 from diphtheria. The mean annual death-rate from these diseases was equal to 0·9 per 1000, and was 0·2 below the rate recorded in the 97 large English towns. The deaths attributed to whooping-cough, which had been 20, 18, and 12 in the three preceding weeks, were 13 last week, and included 9 in Glasgow and 2 in Coatbridge. The fatal cases from measles, which had been 17, 7, and 9 in the three preceding weeks, rose to 10 last week; of these 10 deaths 6 were registered in Glasgow. The deaths from infantile diarrhœal diseases, which had been 21, 10, and 13 in the three preceding weeks, fell to 10 last week and included 6 in Glasgow and 2 in Aberdeen. The 3 deaths from scarlet fever were slightly below the average in recent weeks, and included 2 which were registered in Glasgow. The 3 deaths from enteric fever exceeded the average in recent weeks, and included 2 in Glasgow. The 2 deaths from diphtheria, which also occurred in Glasgow, showed a marked fall from the numbers in recent weeks.

The deaths referred to diseases of the respiratory system, which had been 77, 64, and 63 in the three preceding weeks, further fell to 61 last week; 26 deaths were referred to different forms of violence, against 26 and 33 in the two preceding weeks.

HEALTH OF IRISH TOWNS.

In the 27 town districts of Ireland, with an aggregate population estimated at 1,205,280 persons at the middle of this year, 671 births and 368 deaths were registered during the week ended Saturday, July 11th. The annual rate of mortality in these towns, which had been 17·7, 15·7, and 16·2 per 1000 in the three preceding weeks, fell to 15·9 per 1000 in the week under notice. During the 13 weeks of last quarter the mean annual death-rate in these towns averaged 19·0 per 1000; in the 97 large English towns the corresponding rate did not exceed 13·8, while in the 16 Scottish towns it was 15·5 per 1000. The annual death-rate in the week under notice was equal to 15·0 in Dublin (against 10·6 in London and 14·1 in Glasgow), 17·0 in Belfast, 15·6 in Cork, 26·6 in Londonderry, 12·2 in Limerick, and 17·1 in Waterford, while in the 21 smaller towns the mean rate was 14·2 per 1000.

The 358 deaths from all causes were 7 below the number in the previous week, and included 38 which were referred to the principal epidemic diseases, against 36 and 47 in the two preceding weeks. Of these 38 deaths, 13 resulted from infantile diarrhœal diseases, 10 from measles, 6 from scarlet fever, 5 from whooping-cough, 3 from enteric fever, and 1 from diphtheria, but not one from small-pox. The mean annual death-rate from these diseases was equal to 1·6 per 1000, against 1·1 and 0·9 per 1000 in the English and Scotch towns respectively. The deaths attributed to infantile diarrhœal diseases, which had been 15, 11, and 14 in the three preceding weeks, were 13 last week, and included 5 in Belfast, 4 in Dublin, and 2 in Londonderry. The fatal cases of measles, which had been 19, 13, and 15 in the three preceding weeks, fell to 10 last week; of these 10 deaths, 6 were registered in Belfast and 4 in Dublin. The deaths from scarlet fever, which had been 8, 2, and 3 in the three preceding weeks, rose to 6 last week, and included 5 in Belfast. The deaths from whooping-cough, which had been 3, 6, and 10 in the three preceding weeks, fell to 5 last week, and included 2 in Belfast and 2 in Dublin. The deaths from enteric fever, which had been 3, 2, and 1 in the three preceding weeks, rose to 3 last week, and included 2 in Dublin. The one death from diphtheria occurred in Belfast, and was considerably below the average in recent weeks.

The deaths referred to diseases of the respiratory system, which had been 68, 57, and 41 in the three preceding weeks, were 53 in the week under notice. Of the 368 deaths from all causes, 109, or 30 per cent., occurred in public institutions and 7 resulted from various forms of violence. The causes of 9, or 2·4 per cent., of the total deaths were not certified either by a registered medical practitioner or by a coroner after inquest; in the 97 large English towns the proportion of uncertified deaths did not exceed 0·7 per cent.

THE SERVICES.

ROYAL NAVY MEDICAL SERVICE.

Staff-Surgeon Frederick Francis Mahon has been promoted to the rank of Fleet-Surgeon in His Majesty's Fleet (dated July 11th, 1914).

The following appointment has been announced: Staff-Surgeon A. T. Gailleton to the *Falmouth*, on recommissioning.

ARMY MEDICAL SERVICE.

Surgeon-General William W. Kenny is placed on retired pay (dated July 14th, 1914). Colonel Tom P. Woodhouse to be Surgeon-General, vice W. W. Kenny, retired (dated July 14th, 1914). Lieutenant-Colonel Frederick W. C. Jones, from the Royal Army Medical Corps, to be Colonel, vice T. P. Woodhouse, promoted (dated July 14th, 1914). Colonel (temporary Surgeon-General) William G. Macpherson, C.M.G., Honorary Physician to the King, to be Surgeon-General to complete establishment (dated July 14th, 1914). Lieutenant-Colonel Thomas W. Gibbard, Royal Army Medical Corps, is appointed an Honorary Surgeon to the King, and granted the brevet rank of Colonel, vice Surgeon-General W. W. Kenny, M.B. (dated July 14th, 1914).

ROYAL ARMY MEDICAL CORPS.

Major Lionel A. Mitchell to be Lieutenant-Colonel (dated July 14th, 1914). Captain Francis Romney Coppinger, from the Indian Medical Service, to be Captain, vice J. B. Hanafin, who exchanges (dated July 15th, 1914).

Surgeon-General R. W. Ford, D.S.O., has taken up duty at Headquarters of the Northern Command at York as Deputy Director of Medical Services.

Colonel R. Kirkpatrick, C.M.G., Assistant Director of Medical Services to the Presidency and Assam Brigades, has been transferred from Calcutta to Darjeeling Cantonment. Colonel T. P. Woodhouse has taken up duty as Deputy Director of Medical Services to the Aldershot Command.

Lieutenant-Colonel F. Caton Jones has arrived home for duty from Meerut Cantonment. Lieutenant-Colonel C. H. Hale, D.S.O., has been transferred from Maymyo, Burma, to hold charge of the Military Hospital at Sialkot Cantonment. Lieutenant-Colonel F. W. Hardy has arrived home from India on leave of absence. Lieutenant-Colonel R. H. Hall has been transferred from the Military Hospital at Cosham to Tidworth Park Camp. Lieutenant-Colonel H. I. Pocock has been transferred from Campbellpore to the Military Hospital at Sialkot. Lieutenant-Colonel A. Kennedy has been placed under orders for service abroad. Lieutenant-Colonel J. J. Gerrard has been appointed Senior Medical Officer to the Sierra Leone Protectorate. Lieutenant-Colonel R. Holyoake has been appointed to hold charge of the Military Hospital at Kamptee Cantonment.

Major A. G. Thompson has arrived home for duty from India. Major R. W. Longhurst has been transferred from Ambala to Subathu Cantonment. Major W. Tibbits has been appointed to Mooltan. Major W. M. H. Spiller has been appointed to hold charge of the Military Hospital at Calcutta. Major J. Matthews has been transferred from Secunderabad to the Military Hospital at York. Major S. W. Sweetnam has arrived home for duty from Ambala. Major C. W. Mainprise has been transferred from Rawal Pindi to Kuldana Cantonment. Major E. E. Parkes has been transferred from Plymouth to the Military Hospital at Jubbulpore Cantonment. Major H. M. Nicholls has joined the Scottish Command. Major L. Cotterill has been transferred from Nowshera to Cherat Cantonment. Major J. G. McNaught, Major J. P. Silver, and Major C. W. Profeit have been placed under orders for service abroad. Major G. J. A. Ormsby has taken up duty in the Irish Command. Major J. F. Martin has been transferred from Sandhurst to the Aldershot Command. Major A. E. Hamerton, D.S.O., has been appointed to the Colchester District. Major R. H. Lloyd has taken up duty at the Military Hospital, Dagshai. An exchange on the roster for service abroad has been approved between Major R. W. Clements and Major S. H. Fairrie; the former officer will now proceed abroad during the coming trooping season instead of the latter. Major R. C. Lewis has arrived home on leave of absence from Gibraltar. Major J. C. B. Statham has embarked for a tour of service in the Sierra Leone Protectorate. Major H. Simson has been granted general leave of absence home from India for four and a half months.

Captain C. J. Wyatt has arrived home for duty from the Sierra Leone Protectorate. Captain G. A. D. Harvey has been appointed to the Egyptian Army. Captain D. P. Watson has been appointed to the Irish Command. Captain R. F. O'T. Dickinson has been transferred to the Home Establishment from India. Captain G. Petit has taken up duty in the Eighth (Lucknow) Division on transfer from the Third (Lahore) Division. Captain R. Storrs has joined at Winchester. Captain F. T. Turner has been appointed to the Southern Command. Captain F. A. H. Clarke has been transferred from the Military Hospital at Calcutta to Lebong Cantonment. Captain J. B. Hanafin has arrived home on leave of absence from Ambala Cantonment. Captain J. Fairbairn has been appointed to the Scottish Command. Captain D. Ahern has been transferred from Dublin to the Military Hospital at the Curragh Camp. Captain J. J. H. Beckton has been appointed to the Military Hospital at Rawal Pindi. Captain W. K. Beaman has taken up duty in the Northern Command. Captain E. B. Booth has joined at Tower Hill, West Africa. An exchange on the roster for service abroad has been approved between Captain H. E. Priestley and Captain H. B. Kelly; the former officer will now proceed abroad during the coming trooping season instead of the latter. Captain C. T. V. Benson has been appointed Staff-Surgeon at Fort St. George, Madras. Captain C. W. Bowle has been appointed to hold charge of the Military Hospital at Enniskillen. Captain F. W. M. Cunningham has been transferred from the Sialkot Cantonment to the Murree Hills. Captain W. W. Boyce has been appointed to the Aldershot Command. Captain C. M. Rigby has been appointed to officiate as Surgeon to the Governor of Bombay. Captain J. D. Bowie has been appointed to the staff of the Military Hospital at Calcutta.

Lieutenant A. F. C. Martyn has embarked for Egypt. Lieutenant O. W. J. Wynne has been appointed Specialist in Advanced Operative Surgery to the Eighth (Lucknow) Division. Lieutenant R. B. Price, Lieutenant J. B. A. Wigmore, and Lieutenant J. Hare have been placed under orders for service abroad. Lieutenant A. G. Bigham has been transferred from York to the Military Hospital at Rawal Pindi. Lieutenant H. F. Panton has been transferred from Lahore to the Mhow Division. Lieutenant R. W. Vint has been appointed to the Military Hospital at Lucknow Cantonment. Lieutenant W. O. W. Ball has been placed in medical charge of the Cavalry Barracks at Longmoor.

INDIAN MEDICAL SERVICE.

The King has approved of the retirement of Surgeon-General Aylmer Martin Crofts, C.I.E., K.H.S. (dated May 25th, 1914).

Lieutenant-Colonel L. F. Childe has been appointed Principal of the Grant Medical College at Bombay. Lieutenant-Colonel C. A. Johnstone has joined at Mhow. Lieutenant-Colonel W. D. Sutherland has been appointed Imperial Serologist. Lieutenant-Colonel P. Carr-White has been appointed Residency Surgeon and Assistant to the Resident in Nepal State. Lieutenant-Colonel H. B. Melville has been placed on special deputation duty at Delhi. Lieutenant-Colonel J. Jones has joined at Bombay. Lieutenant-Colonel G. Y. C. Hunter, superintendent of the Central Prison at Buxar, has been granted six months' extension of leave.

Major T. S. B. Williams has been appointed Residency Surgeon to Gwalior State. Major A. M. Fleming, civil surgeon at Jubbulpore, has been appointed to officiate as Superintendent of the Central Prison at Jubbulpore during the absence of Captain W. J. Powell, transferred to the Central Research Institute at Kasauli Cantonment. Major R. F. Baird has been appointed to hold civil medical charge at Benares Cantonment. The services of Major A. W. Greig have been placed permanently at the disposal of the Government of the Punjab for employment in the Prison Department. Major S. Hunt has been appointed Residency Surgeon in the Persian Gulf. Major F. S. C. Thompson has been appointed Superintendent to the Central Jail at Alipore.

Captain W. H. Odlum has been appointed Medical Officer to the 30th Lancers. The services of Captain H. H. King have been placed temporarily at the disposal of the Director-General for employment on special duty in connexion with the prevention of malarial fevers. Captain C. L. Dunn, Deputy Sanitary Commissioner to the United Provinces of Agra and Oudh, has been granted eight months' leave of absence home from India on medical certificate. Captain R. A. Chambers has taken up duty as Staff Surgeon at Bangalore. The services of Captain A. F. Babonau have been placed temporarily at the disposal of the Chief Commissioner of Assam for civil employment in the Medical Department. Captain T. H. Bonnar, civil surgeon to the Garo Hills District, has been appointed Magistrate in that area. Captain J. F. Boyd has been appointed to officiate as Civil Surgeon to the Bareilly District.

SPECIAL RESERVE OF OFFICERS.

Royal Army Medical Corps.

The undermentioned Captains to be Majors:—William H. G. H. Best (dated April 30th, 1914). James C. Furness (dated June 18th, 1914).

The undermentioned to be Lieutenants (on probation):—Cadet George Harold Rossdale, from the Oxford University Contingent, Officers Training Corps (dated June 3rd, 1914). Henry Cuthbert Bazett (dated June 19th, 1914).

TERRITORIAL FORCE.

Royal Army Medical Corps.

2nd South-Western Mounted Brigade Field Ambulance, Royal Army Medical Corps: Lieutenant Rupert Waterhouse to be Captain (dated Oct. 15th, 1913).

1st West Lancashire Field Ambulance, Royal Army Medical Corps: Samuel McCausland to be Lieutenant (dated June 1st, 1914).

1st London (City of London) Field Ambulance, Royal Army Medical Corps: Cadet Lance-Corporal Eric Donaldson, from the University of London Contingent, Senior Division, Officers Training Corps, to be Lieutenant (dated July 11th, 1914).

2nd London Sanitary Company, Royal Army Medical Corps: William John More Slowan to be Lieutenant (dated June 9th, 1914).

For attachment to Units other than Medical Units.—John Livingston to be Lieutenant (dated May 23rd, 1914).

Attached to Units other than Medical Units.—Maurice Cameron Anderson to be Lieutenant (dated June 11th, 1914). Lieutenant Kenneth Mackinnon resigns his commission (dated July 11th, 1914).

JOURNAL OF THE ROYAL ARMY MEDICAL CORPS.

The July issue of this journal opens with a paper on Humidity and Heatstroke, by Colonel R. J. S. Simpson, C.M.G., which is intended to be read in connexion with Dr. M. S. Pembrey's article on Heatstroke in the June issue of the same journal. Major H. Ensor, D.S.O., writes an interesting description of a Day's Work on the Sudan Sleeping Sickness Commission, and Major J. C. B. Statham contributes a Report on a Series of 833 Medical Pyrexias occurring in the Sierra Leone Garrison during the period October 1912–1913, with remarks on the bearing of these diseases on the health of the troops. An important joint communication by Major S. L. Cummins, Captain C. J. Coppinger, and Lieutenant A. L. Urquhart appears under the title of Further Observations on the Presence of Antibodies for Micrococcus Melitensis in the Milk of English Cows. The paper is a report in some detail on the milk of one of a series of 7 cows from a London dairy examined for agglutinins. Two of these animals gave positive results, one of which, Cow 5, was found to agglutinate micrococcus melitensis in dilutions varying from 1 in 250 to 1 in 1000 on different dates. In the result the milk, whey, and blood serum of Cow 5 behaved towards micrococcus melitensis in a manner comparable to the body-fluids of animals suffering from, or immunised against, this organism, due allowances being made for differences in concentration of "antisubstances" and degrees of immunity. Colonel R. H. Firth discusses Osmosis in an article complementary to one on Colloids and Solutions which he contributed to a previous issue.

DEATHS IN THE SERVICES.

Staff-Surgeon Archibald Leslie Archer, R.N. (retired), at his residence, 2, Donegal-terrace, Stoke, Devonport, on June 17th, in his 87th year. Shortly after graduating as M.D. Edin. in 1849 he entered the Royal Navy as assistant surgeon. He served on H.M.S. *Nile* in the Baltic Sea during the Russian war of 1854–55, and was awarded the Baltic medal. He retired from the service in 1860. Staff-Surgeon Archer took a great interest in all public matters in Devonport; he was formerly a member of the local town council and on the honorary staff of the Royal Albert Hospital. In 1858 he was appointed assistant actuary to the Royal Naval Annuitant Society at Devonport.

EPSOM COLLEGE: FOUNDER'S DAY.—The President of the College, the Earl of Rosebery, K.G., is expected to attend the annual prize giving on July 25th, the last over which the present headmaster will preside. There will be service in the College chapel at 2.45 P.M., and the prizes will be distributed in the big schoolroom at 3.15.

THE GOVERNMENT OF INDIA'S SANITARY POLICY.

(FROM A SPECIAL CORRESPONDENT.)

THE Government of India have issued an important resolution on the subject of sanitary progress and development in India. The resolution lays down three broad principles on which sanitary work must proceed in India. It must rest on a knowledge of the people, their conditions of life, their prejudices, social customs and habits, their surroundings and financial means, and it must secure their coöperation. It must recognise the diversity of local conditions in a country which includes numerous communities, castes, and creeds, which exhibits almost every variety of climate, temperature, humidity, and level of subsoil water. Its introduction must be preceded by preliminary local surveys, inquiry, or experiment. The policy of the Government of India is to keep the control of research under itself, but to decentralise other branches of sanitation.

It then proceeds to consider the present state of our knowledge with respect to all the principal diseases of India, and also on such subjects as infantile mortality, vital statistics, urban sanitation, conservancy, water-supply, drainage, epidemic diseases, pilgrim centres and pilgrimages, the adulteration of food and drugs, adulteration of milk, town planning and relief of congested areas, and rural sanitation. On each point it indicates the state of knowledge so far reached and the broad lines of the policy which should be pursued in future. It concludes with the expression of the opinion that the diffusion of sound education will remain a most potent and penetrating instrument of sanitation among a population which still views it for the most part with hostility or unconcern.

Investigations into the Causation and Prevention of Disease.

Research is slowly lifting the veil which hides the secrets of disease and mortality and opening up fields of inquiry scarcely thought of a generation ago. In 1902 a research institute was founded at Guindy, in Madras, named the King Institute after Lieutenant-Colonel King, C.I.E., I.M.S., in view of his devoted efforts in the cause of sanitation in that presidency. The Central Research Institute has been established at Kasauli. The Plague Research Laboratory at Parel has been extended and re-equipped, and is now the bacteriological laboratory for the Bombay Presidency; and a proposal is under consideration to attach to it a school of tropical medicine. A research laboratory and school of tropical medicine are under construction at Calcutta. Pasteur institutes exist at Kasauli and Coonoor. A third is about to be established in Burma, and it is under discussion to establish others in Assam (where it will be combined with a research laboratory) and Bombay.

Besides the routine work connected with the bacteriological diagnosis of disease, antirabic treatment, the manufacture of various vaccines and sera, and general research, these laboratories at different times have been centres of many special investigations, notable amongst which are those on plague and enteric fever. It is hoped that before long each province in India will have a laboratory fully equipped for research. The foundation of the Indian Research Fund Association in 1911 has marked an important era in sanitary progress. The association has been active and can already point to some achievement. Out of an income of Rs.15 lakhs (£100,000) received since its incorporation and up to the end of 1913–14, an expenditure of over Rs.14 lakhs (£93,333) has been sanctioned. In 1911 Major S. P. James, I.M.S., was deputed to study yellow fever in its endemic area and to draw up proposals for protecting India against the introduction of the disease. These proposals are still under consideration. In the meanwhile, stegomyia surveys have been carried out in Calcutta, Bombay, Madras, Karachi, Rangoon, and other seaports. Antimalarial schemes based on preliminary surveys have been carried out at a cost of Rs.6,02,000 (£40,133). Investigations are at present in progress into the problems connected with the prevalence of cholera, kala-azar, dysentery, leprosy, and goitre.

Malaria and Plague.

The report states that the conditions and causes underlying the prevalence of malaria vary greatly in different places, and no one antimalarial measure is suitable for all. Quinine both as a prophylactic and curative agent is of great value to the individual. Its powers of saving life, alleviating sickness, and destroying sources of infection cannot be overestimated. There should be no relaxation of the efforts to educate the people in the use of the drug, and its sale by shopkeepers in rural areas might well be encouraged. The regular administration of quinine to children in schools during the malarial season is a practical measure of easy application and of proved ability; it is valuable alike for its immediate good effects on the health of the scholars and as a means of spreading knowledge of the use of quinine. The treatment of permanent collections of water is important whether it be effected by water tidiness, through sloping of banks and clearing of weeds, or stocking with fish of proved ability as mosquito destroyers or by both methods.

As regards plague, the chief conclusions that have been reached so far may be summarised as follows. In India, where the pneumonic form of the disease is relatively rare, plague is essentially a disease of rats communicable to man and a few of the lower animals; an epidemic amongst men is directly dependent upon an epizootic among rats. Plague spreads from rat to rat and from rat to man through the agency of the rat-flea. The plague bacillus under natural conditions does not long retain its vitality outside the body of the rat, the rat-flea, or man. Plague has a definite seasonal prevalence, generally constant for any given place, but varying in different parts of India; investigation shows that the plague season coincides with the season of maximum prevalence of rat-fleas. Infection is carried from place to place only over short distances by the spontaneous movement of rats; in other cases infection is carried either (*a*) by the agency of man or personal effects acting as a means of transport for infected fleas; or (*b*) by means of merchandise, which may contain rats as well as fleas. It is not yet established which of these two agencies is the more important, but recent work, both in India and the Far East, has emphasised the importance of grain as a vehicle for the transmission of infection.

In comparatively few places in India does plague infection survive the adverse conditions of the non-epidemic season: such places are usually either (*a*) large towns, or (*b*) places which have been infected late in the epidemic season. In places which have suffered from repeated and severe epidemics of plague the rats have become less susceptible to plague than are the rats in places which have remained plague-free or have suffered but slightly. These conclusions, says the resolution, have been arrived at after much careful and painstaking research, and constitute a great advance on the knowledge of plague which was available when in 1896 it first appeared in Bombay. They point apparently to a simple solution of the plague problem—no rats, no plague.

Urban and Rural Sanitary Problems.

The resolution then deals with other diseases, infantile mortality, scavenging, and the adulteration of food. While much has been done to provide drainage and pure water in large cities, there can be little hope of improving their sanitary condition permanently until measures are taken to relieve congested areas and to provide broader streets and buildings more open to sun and air. The constitution in 1898 of the Improvement Trust in Bombay marked a notable step in advance. By the end of 1912–13 the Bombay Trust had incurred an expenditure of Rs.488 lakhs (£3,253,333) towards schemes aggregating 802 lakhs (£5,346,666). Broad roads have been driven through the heart of the city, slum areas have been abolished, and dwellings provided for the accommodation of the poorer classes.

The difficulties which surround rural sanitation in India are well known and persistent. Contaminated sites, polluted water-supply, badly constructed and insanitary dwellings, and the habits and prejudices of the people raise obstacles to progress, which in most provinces are still well-nigh insuperable. The Government of India have informed local governments that they are at liberty to expend a portion of the imperial grants for urban sanitation on rural sanitation, provided practical schemes for this purpose are forthcoming, but they have postponed special imperial grants for this purpose until such schemes are more generally advanced. They fully appreciate the enormous importance of rural sanitation in a country which is mainly agricultural. Past experience and present conditions, however, indicate that the subject is still one for experiment on lines conceived to attract the coöperation of the people. Without their cordial help no sanitary staff could effectively deal with the village sanitation of the 220,000,000 who inhabit rural areas in British India. The danger of employing low-paid and imperfectly trained subordinates in a matter so closely affecting village life is now generally recognised and should never be out of mind.

The resolution then points out the importance of education and concludes: There is room for many workers in the sanitary field. The Governor-General in Council appeals with confidence to all who are interested in the well-being of India to join with him and the local governments in a sustained endeavour to give effect to His Imperial Majesty's most gracious wish that the homes of his Indian subjects may be brightened and their labour sweetened by the spread of knowledge with all that follows in its train, a higher level of thought, of comfort, and of health.

Home and Foreign Notes.

(FROM OUR OWN CORRESPONDENTS.)

MANCHESTER.

A Visit of American Surgeons.

A PARTY of American surgeons visited Manchester on July 8th. The visit was organised by the American Gynæcological Society in order that its members might have the best opportunity of seeing the work which is being done in their own departments away from home. Most of the chief cities and universities of the United States sent representatives to Manchester, which is one of the five cities in England and Wales on the definite programme of the visitors. The Royal Infirmary, the St. Mary's Hospital, and the Lying-in Hospital were visited. At the Royal Infirmary our visitors were obviously much impressed by the arrangement and the very thorough equipment of the spacious buildings. The homeliness and comfort obtained simultaneously, and the decoration of the wards with flowers appealed to them. Surprise was expressed that, as usual, the public hospitals in this country have no accommodation for private patients who might wish for more luxurious surroundings. What, however, pleased the surgeons most was that they saw in the operating theatres of the institutions they visited "swift, skilful, and expert operating," and "sane, wise, direct, careful work"—I quote their flattering words.

Increase of Medical Students at Manchester.

The graduation ceremonial took place on July 4th. From the annual reports issued by the Vice-Chancellor we find that in the Faculty of Medicine during the session 1913–14 there were 305 students of medicine, 34 being women. In the Faculty of Medicine 129 students were working in preparation for the examinations of Manchester University; 4 for the University of London; 6 for other universities; 3 were preparing for the Fellowship of the Royal Colleges of Surgeons of England; 2 for the F.R.C.S. of Edinburgh; 2 for the L.S.A.; 33 were preparing for the Conjoint Examination of the Royal College of Physicians and Surgeons of England; 2 for the Diploma in Psychological Medicine; 3 for the Degree in Dentistry; 57 for the Diploma in Dentistry of Manchester; 13 for the Diploma in Dentistry of the Royal College of Surgeons of England; 53 were working in the following special departments—viz., pharmaceutical, 3; public health, 46 (37 of these were preparing for the Diploma in Public Health, 4 for the Diploma in Veterinary State Medicine, 7 for the tuberculosis course, and 5 carrying out research); and 4 were taking special medical courses. The number of beginners in medicine was considerably above that of previous years. The total number of students during the academic year was 1654.

Successful Appeal for the Radium Scheme.

At one time it seemed that the Manchester radium scheme might have to be either abandoned or postponed until the necessary £25,000 was obtained. The results of the initial appeal fell far short of the expectations of the committee. The address of Dr. Dawson Turner gave an enormous impetus to the scheme; the striking feature, however, is what has been done largely through the enterprise of the newspapers, more especially of those controlled by Messrs. Hulton and Co. All the arts, devices, and carefully worded appeals that energetic journalists know well how to employ have been used with almost magical and immediate results. For a long time there was a standstill at £8000. A "Radium Day" was instituted in Manchester and other towns; and appeals were made in all directions. As the cause was good, Manchester and the neighbouring towns have responded most handsomely, and the working men and women have contributed according to their means. In a little over a fortnight the total contributions have increased from £8000 to £18,450. The Joint Committee have appointed Mr. Hartley Lupton, of the Physical Laboratory of the University, to be physicist in charge of the radium department about to be instituted in the Royal Infirmary, while Dr. Marsden, of the same laboratory, will be consulting physicist. The department will be got ready under their direction, and it is hoped that an initial supply of radium will be available in October.

Poor-law Children and Ophthalmia.

Owing to the prevalence of ophthalmia amongst Poor-law children in Crumpsall, and also to the fact that there were more children at Crumpsall than there is accommodation for, the Manchester board of guardians decided on July 8th to ask the sanction of the Local Government Board in respect of the purchase of a building at a cost of £7250 to be used for children suffering from ophthalmia. The situation ought to be relieved by the proposed facilities for isolation of the affected children.

Lancashire and the Annual Factories Report.

The annual report of the Chief Inspector of Factories, which was issued on July 8th, contains some remarks which have a special interest for Lancashire. The total number of persons employed in factories was 4,488,774 and in workshops 638,335. Textile factories accounted for 18,323 accidents and non-textile factories for 145,495. It is stated that from 25 to 40 per cent. of all industrial accidents are preventable if all practical means are taken. The establishment of safety committees of men and officials is recommended. Action is being taken in the cotton area in regard to the lifting of heavy weights. Cases are mentioned of children lifting skips of cotton weighing 56 lb., and of others of 13 to 16 years of age lifting up to 82 lb. As to the removal of dust, it is stated that the cotton industry can claim one of the greatest successes in regard to the removal of the dust factor as a cause of many diseases. In regard to carding engines, the report states: "It is literally true that the conditions of life have been entirely changed for many strippers and grinders, and all who have been connected with the carrying out of this reform (whether operative, employer, or inspector—and all have had a hand in it) must look with intense satisfaction upon the results of their labours."

Small-pox in Several Lancashire Towns and some Indirect Consequences.

Some time ago there were a number of cases of small-pox in Milnrow, one case also occurred in Salford, two cases at Marland and Rochdale, and another at Oldham. There was one death from small-pox at Rochdale, this being the fifth case since the outbreak a month ago. The Rochdale patient who died was an unvaccinated child who had been taken to the Marland Fever Hospital to be treated in the fever section for scarlet fever. The health committee has decided that so far as practicable no further small-pox cases are to be treated at the fever hospital. Four cases —including the fatal one—have been reported from the vicinity of the fever hospital. One case is reported from Colne. The Rochdale board of guardians has been informed by the Lancashire asylums board that no lunatics from that district can be received in any of the five county asylums in consequence of the existence of small-pox in Rochdale union. These outbreaks have excited some alarm at the seaside resorts to which Lancashire people at this season flock in their thousands. To allay this alarm the Rochdale Trades Council decided to send a resolution to the trades councils at the various health resorts pointing out that the reported cases were of a mild type.

July 14th.

BRISTOL AND WESTERN COUNTIES.

A New Hostel for the University of Bristol.

THE University of Bristol has during its brief career already acquired various premises for use as residential hostels. Their latest purchase is the Imperial Hotel, which stands close to Clifton Down station, at a distance of about half a mile from the main buildings of the University itself.

Bristol Royal Blind Asylum.

As was stated in these columns a short time ago, the Bristol Blind Asylum is issuing an appeal for funds to create a capital sum, the interest of which is to be used for supplementing the wages of the blind workers of the institution from 9*s.* 9*d.* per week for men and 4*s.* for women to £1 and 12*s.* 6*d.* respectively. In order to realise this object increased subscriptions will be needed, as well as an endowment fund of £20,000. Half this sum has been anonymously promised on condition that the remainder is forthcoming, and additional promises totalling almost £4000 have also been made.

Working Hours of Nurses.

The Bristol health committee has approved of substantial reductions in the working hours of the nurses in the city isolation hospitals, a matter in which Bristol has been behind other large towns. This, if adopted, will necessitate an increase in the staff, and it cannot therefore take effect till further accommodation can be provided.

Memorial to Dr. Edward Adrian Wilson.

Last week, at Cheltenham, Sir Clements Markham, K.C.B., formally unveiled the statue in bronze of the late Dr. E. A. Wilson in the presence of a large and distinguished gathering. Dr. Wilson is represented in Polar dress, and the statue is 7 ft. high, on a pedestal of equal height, and was designed by Lady Scott. The inscription is as follows:—

> Edward Adrian Wilson, B.A., M.B. Cantab., F.Z.S., born in Cheltenham 1872. Chief of the Scientific Staff, Artist, and Zoologist of the British Antarctic Expedition, 1910–13. He reached the South Pole January 17th, 1912, and died with Captain Scott on the great ice barrier March, 1912. "He died, as he lived, a brave true man, the best of comrades, and staunchest of friends" (letter from Captain Scott).

The Proposed Tuberculosis Hospital at Torquay.

Considerable opposition is manifested locally against the proposal of the Devon county council to erect a county tuberculosis hospital at Torquay. The Torquay town council has also protested against the scheme, and owing to the requisitions of ratepayers the Local Government Board has decided to hold an early inquiry into the matter.

The British Dental Association.

The annual meeting of the Western Branch of the British Dental Association was recently held at the Devon and Exeter Hospital, Exeter, under the presidency of Mr. R. Willcox (Clifton). There was a good attendance. Mr. Willcox in his address alluded to recent changes which had taken place in dentistry, and which had brought dentists into closer coöperation with the medical profession. Mr. W. H. Goodman (Exeter) was later inducted to the presidency and gave an interesting paper on Anæsthetics in Dental Surgery.

Royal Devon and Exeter Hospital.

The committee of the Royal Devon and Exeter Hospital has issued a strong appeal for £10,000 for making several improvements to the institution, including the erection of a new wing. Up to the present nearly £1300 have been promised.

Death of Mr. H. B. Mugliston.

Mr. H. B. Mugliston has recently died at his residence, Brent Knoll, Somerset, where he practised. He was the son of Mr. G. T. W. Mugliston, surgeon, formerly of Pinner. After qualifying Mr. Mugliston held the appointment of house surgeon at the London Hospital. He was afterwards called to the Bar and joined the South-Eastern Circuit. He then went to Tasmania and entered into the political life of the island, being a prominent member of the Legislative Assembly. Mr. Mugliston later resided in Australia, and subsequently came to Brent Knoll, where he was highly esteemed.

July 14th.

IRELAND.

Tuberculosis in Ireland.

ALTHOUGH the death-rate from tuberculosis in Ireland is steadily falling it still remains lamentably high. In the year 1912, according to the reports of the Registrar-General for Ireland, 9437 deaths were registered as due to tuberculosis, being 2·15 per 1000 of the population. The whole question is critically considered by Sir John Moore in two papers recently published.[1] He points out that although Ireland was the first division of the United Kingdom to apply the principle of notification to tuberculosis by means of Act of Parliament, that notification was permissive and not compulsory. The Tuberculosis Prevention (Ireland) Act of 1908 allows any urban or rural sanitary authority to adopt notification subject to the approval of the county council. Ireland is divided into 311 districts for public health and local government purposes, and of these up to March 1st, 1914, only 55 have adopted the principle of notification—viz., three county boroughs, 20 urban districts, and 32 rural districts. An attempt was made in 1912 to render notification compulsory through the medium of an amending Bill rendered necessary to facilitate the treatment of insured persons under the National Insurance Act of 1911. The compulsory notification clauses were strongly opposed and had to be deleted. The Irish Local Government Board, commenting on this, observed: "It is much to be regretted that compulsory notification had to be omitted, as it leaves this country (Ireland) in the unfortunate position of being the only portion of the United Kingdom where it is not in force, although the disease is more prevalent in Ireland and consequently is more urgently needed." Sir John Moore shows that even in some districts where notification has been adopted, the notifications fall far below the recorded number of deaths; he concludes, therefore, that many cases of pulmonary tuberculosis are not notified at all in the largest cities of Ireland. He urges very strongly that for the crusade against tuberculosis in Ireland to be successful the following measures should be carried out. Notification of all forms of the disease should be made compulsory in all parts of the country. Whole-time county medical officers of health should be appointed, independent of local influences and responsible only to the Irish Local Government Board. The system of district nurses should be extended, and trained female sanitary inspectors should be appointed. An effective domiciliary treatment should be arranged for cases which cannot be accommodated in institutions, and instruction as to the rules of life should be widely given. Lastly, he points out the importance of the housing problem. Some statistics which he quotes give point to many of his recommendations. The Registrar-General for Ireland, Sir William Thompson, in his report for 1912, shows that in the Dublin registration area the death-rate from all forms of tuberculosis classified according to social state was as follows: in the professional and independent classes, 0·41 per 1000; among the middle class, 1·92 per 1000; among the artisans and petty shopkeepers, 2·94 per 1000; and among the general service class, 3·16 per 1000. Sir John Moore writes with conviction, and has made out a very strong case for the measures which he recommends. There can be no doubt that if they were effectively carried out the incidence of tuberculosis in Ireland would be greatly lessened.

---

[1] Notification of Tuberculosis in Ireland and the Reasons Therefor. Dublin Journal of Medical Science, May, 1914. Tuberculosis in Ireland and the Crusade against it, Interstate Medical Journal, vol. xxi., No. 4, 1914.

Irish Medical Committee.

The first meeting of the new Irish Medical Committee was held in the Royal College of Surgeons of Ireland on July 14th. Dr. P. J. Macnamara, of Kilmallock, was appointed chairman for the ensuing year, and Dr. Johnson, of Belfast, vice-chairman. Mr. Gick, secretary of the Irish Medical Association, and Dr. Henessey, organising secretary of the Irish Committee of the British Medical Association, were appointed joint secretaries of the committee. The following subcommittees were appointed: Finance and executive, sanatorium benefit, matters affecting the Poor-law medical service, and hospitals.

Queen's University of Belfast.

The fifth graduation ceremony of the Queen's University of Belfast was held on July 9th, when, in the absence of the Chancellor, the Earl of Shaftesbury, K.C.V.O., the Vice-Chancellor presided, and the various degrees were conferred. At a meeting of members of convocation held on the same day it was decided to nominate a number of gentlemen for election as members of senate (convocation having the power to select eight). The following four members of the medical profession were chosen: Dr. R. W. Leslie, Dr. W. Calwell, Dr. John W. Browne, and Dr. T. S. Kirk.

Rainfall in Belfast for June.

During the past month of June rain—to the amount of 1·52 inches—fell on 16 days in Belfast, making a total of 15·55 inches for the present year. This rainfall for June is distinctly below the average for that month (3·06 for the previous 39 years); indeed, the total amount of rainfall registered for 1914 is only 15·55 inches, the amount for 1913 up to the same time (half a year) being 21·50 inches.

Public Abattoir at Ballymoney.

The committee appointed by the urban council of Ballymoney to inquire into the question of a public abattoir has sent in a very full report, in which they state that the present condition of matters made it obligatory for the council, as the sanitary authority, to take steps to have a public abattoir erected in Ballymoney. Consideration of the proposal was adjourned to September.

July 14th.

SCOTLAND.

Royal Visit to the Hospitals of Glasgow.

As I briefly recorded last week, the city of Glasgow, and the hospitals in particular, were honoured by a visit from the King and Queen, accompanied by their daughter Princess Mary. As Prince of Wales, His Majesty in 1907 laid the foundation-stone of the new Royal Infirmary, and last week he formally opened the building as the Glasgow Memorial of the Diamond Jubilee of Queen Victoria. Before leaving the infirmary a deputation from the Royal Faculty of Physicians and Surgeons of Glasgow presented an address to the King. After lunch a visit was paid to the new buildings of the Royal Hospital for Sick Children. The chairman of the directors presented the King with a key with which to unlock the door and declare the building open, and thereafter a minute inspection was made of the hospital. Later in the day brief visits were paid to the Western Infirmary and to the University, where Lord Rosebery, as Chancellor of the University, presented the Principal and several members of the Senate to Their Majesties.

Lister's Operating Theatre.

At a meeting of the Glasgow University Court it was announced that the managers of the Royal Infirmary were willing to accede to the request of the University Court that they might obtain the materials of the Lister ward and operating theatre in the old building of the Royal Infirmary. It is intended that the ward and theatre be reconstructed at the University as a memorial of Lord Lister's work.

Graduation Ceremony at the University of Aberdeen.

The summer graduation at the University of Aberdeen took place on July 8th, at the same time as the ceremony of installing Lord Elgin as Chancellor in succession to the late Lord Strathcona. Lord Elgin was introduced by Mr. D. M. M. Milligan, and Principal George Adam Smith, the Vice-Chancellor, amid much enthusiasm, administered the oath. In his address Lord Elgin alluded to his call from Mr. Carnegie, the present Rector of the University of Aberdeen, who was present to take the chairmanship of the Carnegie Trust and to the growing success of the trust. The Principal and Mrs. George Adam Smith entertained the honorary graduates to luncheon, and in the afternoon a garden party was held at Chanonry Lodge, when the members of the University had an opportunity of meeting Lord and Lady Elgin and the Rector and Mrs. Carnegie. In the evening the Chancellor was entertained to dinner by the University in the Portrait Gallery of Marischal College. There was a large and distinguished company. The Principal, in submitting the toast of the evening, stated that Lord Elgin was the thirty-eighth Chancellor since the foundation of the University and King's College in 1494. After alluding to the long and illustrious line of chancellors Principal Smith said that few political careers, either in our own time or at any previous period, had been tested, as Lord Elgin's was, by the emergence of sudden and terrible crisis of the severest kind in India.

Death of Dr. J. F. Robertson.

The death occurred at Lerwick, on July 10th, of Dr. John Fordyce Robertson, after a brief illness. Though in somewhat impaired health he was able to attend to his professional duties up to July 6th, when he was stricken with pneumonia. Dr. Robertson was educated at the Anderson Institute, Lerwick, and at Edinburgh University, where he was a brilliant student. Very soon after he graduated he started private practice in Lerwick, where he soon became a very popular and busy practitioner. He held the rank of captain in the R.A.M.C.(T.), and gave freely of his scanty leisure to further the affairs of the local Territorials, by whom, as by the general public, he was held in high esteem.

July 14th.

PARIS.

The Social Adaptability of Defectives.

IT is often said that the sacrifices made for the education of backward and mentally abnormal children are too often sheer waste, and that the results of this special training are only too commonly deceptive. M. Roubinovitch, who is the chief physician of the hospital school of Bicêtre and of the Vallée foundation, has communicated to the Academy some figures that show the real success which may be attained in a considerable proportion of such children. These are the "educable" children, among whom may be obtained, by rationally directed efforts, a complete adaptation to social life. The clinical history of 14 of these mentally abnormal subjects, affected at the time of their admission with mental debility, simple or complicated with instability or with various perverted instincts, is in this respect very convincing. These defectives, after a stay of from 3 to 12 years in the institutions, show such physical, intellectual, and moral improvement that they may be restored to ordinary life, to which they are perfectly adapted. Of these 14 children, 8 girls are now satisfactory housekeepers, domestics, or washerwomen, while 6 boys are good carpenters or shoemakers. In all, heredity must be accepted as the principal factor in their inferiority, but treatment, as may be seen, is not useless. These useful hospital schools would be much more valuable if they were not encumbered with a considerable proportion of idiots and incurable imbeciles, giving the impression that the expense is out of all proportion with the results to be obtained.

Thyroid Grafting in a Myxœdematous Child.

Dr. Voronoff, of Nice, who reported to the last Congrès de Chirurgie a completely successful case of ovarian grafting, has communicated to the Academy of Medicine the results of thyroid grafting in a child aged 14 years, affected with myxœdema from the age of 8 which followed on scarlet fever. The disease, besides the classic physical signs, was accompanied by a total arrest of intellectual development. The child was feeble, apathetic, and stupid, incapable of attention and of mental work. Dr. Voronoff engrafted in the neck a lobe of the thyroid from a monkey (*Singe papion*), attaching it by a large number of delicate sutures, but without anastomosing the arteries of the gland directly with those of the child, according to Carrel's method. This graft succeeded well, and new vascular connexions were rapidly established between the engrafted tissue and the subject. An interesting point is that, little by little, not only did the physical characters of myxœdema disappear, the obesity diminish, the puffy countenance become oval, the thick lips become thin, and the eye take on a live and alert look, but the intelligence also developed in like manner. The child became attentive and studious, and in six months its intellectual status had become entirely normal. Dr. Voronoff performed this operation at the Clinique Ste. Marguérite of Nice before a considerable number of medical men. He thinks that this method may become general, and that it will provide a mode of treatment in myxœdema more certain and more definitive than the internal administration of thyroid preparations, as hitherto used.

Death of Dr. Duguet.

Dr. Duguet has died at the age of 77 years. He had been professor agrégé at the Faculty of Medicine and subsequently médecin des hôpitaux. At the close of his career he had for a long time occupied the post of head physician of the Hôpital Lariboisière. He was vice-president of the Académie de Médecine, and would have been its president next year. He leaves behind him the memory of a learned clinician, whose researches have covered various parts of internal pathology, particularly that of diseases of the heart.

July 13th.

BERLIN.

Congress of the Medical Societies.

THE Congress of the Deutscher Aerztevereinsbund, held in Munich in connexion with the Leipziger Verband from June 25th to 27th, was especially remarkable from the fact that the subject of club practice, which has played so prominent a part in preceding congresses, was hardly discussed at all, the matter being now regulated by an agreement throughout the empire. One of the principal subjects of discussion concerned a motion brought before the Congress by the Dresden section, that medical coöperation free of charge with so-called charitable institutions ought to be made dependent on the consent of the local medical association. The motion was agreed to with an amendment excepting the Red Cross Society, subject to the condition that members of the Red Cross trained by medical men shall pledge themselves not to settle in practice as unqualified practitioners. In the discussion it was pointed out that certain institutions which required the help of the medical profession free of charge do not expect gratuitous services from other persons. Other subjects dealt with were the unsatisfactory position of midwives, and the courts of honour for medical officers of the reserve, which are exclusively composed of medical officers of the active army without the participation of the reserve medical officers. The struggle against quackery and unqualified practice also came up for discussion, the annual fee for members being raised 1 mark, the additional amount thus collected to be exclusively devoted to this purpose. The social side of the meeting was especially remarkable for a concert given by the medical orchestra of Munich, the performers all wearing operating dress. Dr. von Bary, formerly a medical man and now member of the Royal Opera of Munich, took part in the performance.

Statistics of Berlin University.

At the University of Berlin 8537 students have been matriculated this summer, or 500 more than in the preceding summer. The number of women students has especially increased, being 841, as against only 709. The theological faculty has 511 men and 2 women students, the faculty of laws 1564 men and 17 women, the medical faculty 2130 men and 176 women, and the philosophical faculty 3491 men and 665 women. The report further states that 5545 men and 665 women were Prussian, 897 men and 69 women Germans from other States of the Empire, 203 men and 21 women were Austrian, 502 men and 40 women Russian, 62 men and 4 women came from Roumania. 56 men and 3 women from Switzerland, 35 men and 1 woman from Turkey, 34 men from Greece, 33 men and 5 women from Servia, 30 men from Bulgaria, and 26 men and 5 women from England. From America came 109 men and 20 women, from Asia 80, from Africa 12, whilst Australia was not represented at all this summer.

July 13th.

KING'S COLLEGE HOSPITAL.—The following are the senior scholarship and prize examination results: Senior scholarship, Tanner prize in diseases of women, &c., class prize in diseases of children, D. J. Platts; Jelf medal, Todd prize in clinical medicine, class prizes in medicine, obstetrics, pathology, hygiene, and psychological medicine, E. Watson Williams; class prize in forensic medicine, H. Rivers Pollock.

CENTENARIANS.—The death occurred at Brighton (at the house where he had resided since his retirement from the Bar in 1864) on July 13th of Mr. William Augustus Gordon Hake at the great age of 103 years 3 months. Of late years he had suffered severely from bronchial trouble, but so remarkable was his vitality that he withstood the attacks again and again. An attack, however, at last brought about heart failure and a peaceful end. Mr. Hake was a native of Exeter, having been born at David's Hill on April 5th, 1811. He married in 1837 and was the father of nine children—five sons and four daughters. He was the doyen of the English Bar, having been called to the Middle Temple in 1835.—Mrs. Rebecca Clark died at Wood Green on July 4th at the age of 110, from shock after a severe thunderstorm. The aggregate ages of four of the children of the deceased who attended the funeral was 283 years.

ARTIFICIAL PNEUMOTHORAX: DEFECTS IN THE ACCEPTED TECHNIQUE AND HOW TO REMEDY THEM.

To the Editor of THE LANCET.

SIR,—Those who are interested in the subject of artificial pneumothorax will feel grateful to Dr. W. Parry Morgan for his praiseworthy attempt to improve on existing forms of apparatus (THE LANCET, July 11th), but before we adopt his somewhat complicated machinery we should like to be sure that the difficulties it overcomes really do exist, and also that it introduces no new dangers in place of those it is designed to remove. On neither of these points have I been able to satisfy myself in favour of Dr. Morgan's method.

The main defect which he discovers and sets himself to correct in the apparatus at present used is as follows. He contends that when the needle reaches the pleural cavity at a first operation the amount of gas entering from the manometer tubing would not suffice to produce a respiratory fluctuation were it not that the lung is always wounded by the needle and air flows in from this source. I should be far from denying that where a pointed needle is used this misadventure frequently happens *in practice*; indeed, Dr. Morgan brings striking testimony to prove that it has done so, even to the establishment of a "spontaneous" (!) pneumothorax, in his own practice. Such a wounding of the lung, unavoidable I think where a pointed needle is used at a first operation, is likely to be of considerable extent where the technique Dr. Morgan regards as usual is commonly followed. He says that if "movements do not appear in the manometer the needle is usually pushed forward and drawn back until they do so." This I should consider a faulty technique with any needle; if it is entered slowly with due regard to the structures it passes through, and with careful attention to the manometer, it should, in my opinion, never be necessary to draw it back save for its final removal. But I am among those who hold that a pointed needle should not be used at all at a first operation, and am in a position to show that where a blunt instrument is used and the lung certainly not wounded, yet ample respiratory movements are obtained in cases where there is a free pleural space. For at first operations I always use a small trocar and cannula; the trocar is removed as soon as the superficial structures are pierced, and the blunt cannula, which has also a side opening, is thrust forward alone through the parietal pleura which it pierces with a palpable click. With this instrument it is always clear when the pleura is passed, and it would certainly be impossible to wound the lung in cases where the pleural space is free. Yet with such an instrument the respiratory oscillation whose absence Dr. Morgan deplores is, in my experience, always present, and is maintained not only on quiet breathing, but even after deep breathing and cough, a test to which I always subject my cases before the admission of gas. The following small series of intrapleural pressures at first operations with this blunt instrument serve to make this clear:—

W. M.	– 8 to – 16 cm. of water.
B. E.	– 8 ,, – 22 ,, ,,
H. B.	– 4 ,, – 12 ,, ,,
A. A. G.	– 9 ,, – 13 ,, ,,
A. S.	– 7 ,, – 15 ,, ,,
A. M.	– 8 ,, – 12 ,, ,,

Only in cases of adherent pleura have I known the gas sucked out and not returned, being lost presumably among the pleural adhesions.

At the end of his paper Dr. Morgan describes his experience in certain cases where, even after the introduction of some gas, he has failed to obtain respiratory fluctuations when he has cut off the gas reservoir from the manometer. This occurrence seems best explained by a blocking of the needle, an accident which readily occurs with fine needles, such as those of the Brauns or Forlanini pattern, but is always avoidable by the use of a needle of larger bore. The blockage is usually with a piece of punched-out skin, and is generally partial in the sense that gas can be passed in but the manometer fails to record normally. Surely the *fact* that gas had already entered in these cases disposes of Dr. Morgan's apparent contention that it was the need of this which was responsible for the loss of the usual respiratory oscillation.

Certain further strictures which Dr. Morgan makes against the usual apparatus provided with a single water manometer seem to me to be hardly justified by the facts. For pressure with the finger and thumb on one or another rubber tube will make this manometer at once record either the intrapleural pressure, the pressure in the gas bottle, or the average pressure of the two combined, and from these it can just as well be deduced as from Dr. Morgan's two manometers, apart from watching the level of fluid in the gas bottle, whether the flow of gas continues and when it comes to a standstill. As to the risk of fluid being sucked back into the needle when the gas pressure falls to the level of the intrapleural pressure (which indeed need never be allowed), I would ask whether this accident ever occurs in practice; it has not done so to me in the needles with which I am accustomed to operate.

So much for the criticism Dr. Morgan brings against the simple water manometer with its double attachment to the needle and gas reservoir. The apparatus which Dr. Morgan would substitute for it is highly ingenious and compact, but it seems to me doubtful whether its working is not too complicated to commend it to the practical physician. To determine whether the needle is safely within the pleural cavity we are told to "take the reading of the reservoir manometer, then the reading of the intermediate, and from the second reading subtract half the difference between the first and the second." But if the needle is partially blocked two complicated formulæ must be worked out before it can be decided where the point of the needle has got to. I can assure Dr. Morgan from personal experience that the clinician is not always enough of a mathematician to remember or even to work out these formulæ at the bedside; he is likely to prefer the striking visual proof which the simple water manometer affords.

One particularly ingenious point of Dr. Morgan's apparatus is the use of flexible tubing attached to a movable reservoir to replace one arm of the water manometer; by this means the level can be so adjusted that high positive or negative pressures can be recorded on a quite short length of fixed glass tubing. I cannot help fearing, however, that the large volumed reservoir must, by its inertia, greatly damp down those respiratory fluctuations which are so important an index to the position of the point of the needle. Finally, I should have grave doubts myself as to the safety of the continuous flow of oxygen, which is, after all, the main feature of Dr. Morgan's apparatus. Gas embolism is doubtless less easily produced with this gas than with nitrogen, but can it be definitely stated that the risks of gas embolism are negligible so long as oxygen only is used? I do not believe myself that this is so, and it rests, I think, with Dr. Morgan to prove this fact before it can be admitted that his method is free from danger.

I am, Sir, yours faithfully,

Queen Anne-street, W., July 12th, 1914. CLIVE RIVIERE.

THE PLEA FOR IMMEDIATE OPERATION IN APPENDICITIS.

To the Editor of THE LANCET.

SIR,—In your issue of July 11th Mr. W. H. Battle writes:—

> I have said in a former letter that a surgeon can frequently give a correct opinion as to the pathological state of an appendix before its removal in an acute attack of appendicitis from a consideration of the history, symptoms, and local examination of a patient. Mr. Owen denied this.

Permit me to remark that I have made no such denial. For even I, who lay no claim to the gift of clinical or pathological prophecy, sometimes make a correct forecast. So do most surgeons, I suppose. But what I keep hammering at is this, that there are certain cases in which though mortification or perforation of the appendix has taken place, neither the temperature, nor the pulse, nor the aspect, nor the local condition gives warning of impending disaster. Such cases can be saved, if at all, only by immediate operation. And who can forecast them?

As I remarked in my previous letter, I have nothing fresh to say on the important matter which is being discussed in your columns, and I certainly should not have again intervened if I had not been provokingly misquoted.

I am, Sir, yours faithfully,

July 11th, 1914. EDMUND OWEN.

DEFERRED DEATH AFTER TRACHEOTOMY FOR LARYNGEAL DIPHTHERIA.

To the Editor of THE LANCET.

SIR,—In Dr. John Biernacki's interesting article in THE LANCET of July 11th on this subject there is no mention of the bronchoscope in his notes on the related treatment. The use of this instrument in cases of foreign body in the food and air passages has brought about an enormous reduction in the mortality. With some diffidence, owing to my ignorance of conditions in a fever hospital, I note some inconsistency in the paper. It is stated that "recovery is exceptional once obstruction develops to a degree which makes *extraction vital*," and later, "that extraction should be postponed until ...... the obstruction has become immediately dangerous." Naturally *there* is a wide difference between an ordinary case of *foreign* body and of a plug of desiccated mucus in the trachea. There being already a tracheotomy opening it appears that "lower" bronchoscopy need not subject the patient to any more strain than the process so well described by Dr. Biernacki, and that in expert hands it would be safer and more efficient. Naturally under the circumstances the surgeon would require special protection. This, however, presents no insuperable difficulty. It seems that if more than the exceptional cases alluded to are to be saved by clearing the trachea, and possibly the bronchi, the bronchoscope should be used at an earlier stage.—I am, Sir, yours faithfully,

T. JEFFERSON FAULDER.

Harley-street, W., July 13th, 1914.

ULTRAMICROSCOPIC VIRUS.

To the Editor of THE LANCET.

SIR,—In an interesting letter by Dr. J. T. C. Nash, published in THE LANCET of July 4th, it is suggested that very minute individual micro-organisms might escape notice if lying free, but should—theoretically—be easily detected by the microscope when occurring in colonies. To the soundness of Dr. Nash's observation I can fully testify in the case of mumps and of typhus fever. For example, in the case of mumps I have in the last few days found in the fresh urine of five consecutive cases in the stage of fever minute organisms which cannot when lying free be recognised to be organisms by the ordinary 1/12th oil immersion lens. When, however, they occur in clusters an ill-defined mass can be made out, which under a 1·5 mm. apochromatic lens is readily seen to be composed of myriads of well-stained organisms varying between about $0\cdot1\mu$ and $0\cdot3\mu$ in their greatest diameter. (The etiological relationship of these organisms to mumps is now being studied in monkeys.) Similarly in typhus fever, as Dr. W. W. Ingram and I have recently reported, large clusters of minute filter-passing organisms may be seen, especially in the fresh urine and cerebro-spinal fluid, though when lying free the individual organisms are beyond the range of vision unless a specially high objective be employed.

The difficulty of recognition of individual organisms of the small size described is greatly increased if they are embedded in the highly albuminous matrix of a blood film, but is reduced to a minimum in the case of cerebro-spinal fluid and of urine. I am, Sir, yours faithfully,

E. C. HORT.

The Lister Institute, July 8th, 1914.

THE CHILDREN'S COUNTRY HOLIDAY MOVEMENT AND INFECTIOUS DISEASE.

To the Editor of THE LANCET.

SIR,—May I ask you to find space for a few comments on the circular on "Children's Country Holidays," issued by the Local Government Board, and referred to in THE LANCET of July 4th? The Board draws attention to the allegation that from time to time infectious disease has been introduced or spread in country areas, and that overcrowding in country cottages has also been caused by the boarding out of town children during holiday time.

The Children's Country Holidays Fund, which sent over 45,000 London children into the country for a fortnight last summer, and since its establishment by Canon Barnett 30 years ago has provided holidays for more than 1,000,000 children, has for many years given close attention to the points mentioned in the circular. As the fund draws support from such a wide circle of sympathisers, I am sure your readers will be interested to know what regulations are laid down to avoid the dangers suggested.

1. To prevent any risk of sending children to cottages where infection or overcrowding might be possible, the Children's Country Holidays Fund allows no centre to be used unless a lady or gentleman resident in the place has undertaken supervision, and children are only sent to cottages which have been inspected by these honorary "visitors." The latter also see that the definite restrictions as to numbers accommodated in each cottage are observed, and visit the children during their stay so that no breach of the regulations may pass unnoticed.

2. The fund enjoys the coöperation of the London County Council, whose nurses inspect all the children on the score of health and cleanliness before they go away, and report three times on each child before the holiday is given.

3. Honorary assistants of the fund visit the home of every child at least once before the holidays, and in case of any suspicion of illness in the house or immediate neighbourhood a doctor's opinion is obtained. Before the children leave London their parents are required to see that they take with them a supply of clean clothes.

4. A special fund is set apart for medical assistance when required at the country centres, and this fund is drawn upon up to a specified amount in case of need for medical advice, special food, or hospital charges.

Seeing that the Children's Country Holidays Fund has been at great pains to minimise any risks attendant on its work, I should be glad if you would put this brief statement before your readers. I am, Sir, yours faithfully,

F. MORRIS,
Chairman of Executive Committee.

The Children's Country Holidays Fund, 18, Buckingham-street,
Strand, W.C., July 13th, 1914.

THE WORKING OF THE NATIONAL INSURANCE ACT IN GREAT YARMOUTH.

To the Editor of THE LANCET.

SIR,—An article on Medical Practice under the Insurance Act in Great Yarmouth which appeared in your columns last month and was copied by the *Yarmouth Independent* has recently come to our notice.

As it may have given very erroneous impressions we beg leave to point out, first, that there is no evidence but that of hearsay (repeated for the last six or seven years at least) that the local Medical Institute was on the eve of collapse; second, that the National Insurance Act has not given it a new lease of life. Quite the contrary. It is true that it receives more for the insured persons it has retained, but many have left it. Further, as pointed out *ad nauseam* in the medical press, the pledge taken by the medical practitioners prior to the passing of the Act involved points on which the British Medical Association changed its ground radically, breaking its side of the pledge. Being thus left an isolated community after Norwich, Lowestoft, and the surrounding country had given in, the Great Yarmouth medicos held several meetings at which the desirability of all acting together was frequently insisted on and generally accepted. At the last of these meetings the question was put whether a panel should be formed or not. The majority voted "Aye" and expected the coöperation of their colleagues who voted "Nay"; they, however, left the meeting, entirely to the surprise of the majority. It is only fair to say that two opponents put their names on the panel next day and a third offered to do so if we required more names. Subsequently the members of the panel formed a committee to look after their own affairs. They knew it was not a statutory committee then.

and never pretended that it was one. The Local Medical Committee was formed later in due order.

Your correspondent's charge against the members of the Great Yarmouth panel, that they pressed for allocation when contracting out was on the *tapis*, is simply untrue. It was evident from the first that contracting out was not to be allowed except in a few special cases, and allocation was not mooted till several months had elapsed. We were then asked to suggest plans for this step, and had to give our views. We cannot see that the active members of the hospital staff have anything to complain of; they chose their own position and had a special warning of what was coming in a letter which appeared in THE LANCET of June 10th, 1911, p. 1606, a printed copy of which was sent to each of them. Of course, there is room for improvement in the working of the Act and much to be done in reuniting the members of the profession, but we regret to be unable to see any tendency to either of these desiderata in your article. We request that you will kindly give our letter the same publicity that it has received, and remain, Sir,

Yours faithfully,
HENRY BLAKE,
Chairman, Panel Committee.
J. IVOR SANKEY,
Honorary Secretary, Great Yarmouth Division, British Medical Association.
VALENTINE H. BLAKE,
Honorary Secretary, Local Medical Committee.
Great Yarmouth, July 13th, 1914.

⁂ Our Commissioner's informants will not acquiesce in the charges of untruth or of error brought in this letter.—ED. L.

THE NATIONAL MEDICAL UNION.

To the Editor of THE LANCET.

SIR,—Mr. W. L. W. Marshall writing about the National Medical Union in THE LANCET of July 11th says "support may reasonably be expected from the consultant branches of the profession."

May I point out that the National Medical Union is to a very great extent a general practitioners' movement. It depends upon the support of the practitioner who is not on the panel. As numbers of new members have recently joined, and many are joining, it will become a power in the land, representing practitioners who will have nothing to do with the medical service under the present arrangements of the Insurance Acts. But consultants look for patients from panel men as well as from non-panel men.

If consultants learn that the National Medical Union has some backbone in it, and is linking up and giving power and influence to the non-panel practitioners, they will soon support it. It will be a very independent consultant who will ignore his opportunities for fees. There will be more guineas from non-panel doctors' patients than from those doctors who have to resort to the panel. The sick members of the public are seeing to that, and members of the National Medical Union know it.

I am, Sir, yours faithfully,
Hove, July 13th, 1914. THOMAS JOHNSTON.

ISOLATION OF DIPHTHERIA CASES.

To the Editor of THE LANCET.

SIR,—Dr. E. H. Snell did good service at the recent Sanitary Congress at Blackpool when he called attention to the futility of hospital isolation. I have for many years past in my annual and special reports fought against sending this class of patient to hospital. After 27 years the hopelessness of making any advance in dealing either with scarlet fever or diphtheria becomes more apparent. In some places a sanitary authority must contend with Socialism, so-called, in others feudalism, in others clericalism, and in others all three dispensations combined. The struggle for power in each case predominates, and each faction assumes that its knowledge extends to the sphere of infective disorders and that sanitary authorities are merely the servants of the dominant faction. At the present moment the knowledge claimed about germs is prodigious and very disastrous. Last year there were 130,026 cases of scarlet fever notified in England and Wales, against 107,417 in 1912 and 104,617 in 1911, and there were 50,850 notifications of diphtheria, against 44,687 in 1912 and 47,747 in 1911. The tightening up of official rules and regulations is obviously of no avail and never will be. Disease cannot lend itself to official methods, and refuses to be strangled with official red tape. Both diseases are caused by a local infection, and it appears reasonable to suppose that attention to the toilet of the throat and the disinfection of what comes from that region and its neighbourhood is of the utmost importance. Isolation, when these points are attended to, is a simple matter, and in country districts certainly can more often than not be carried out with sufficient completeness. At the present moment in an outlying part of my district two cases of scarlet fever are being isolated in a cottage without anything dreadful occurring; about one mile away there is a second case which developed five days after the return of another patient from hospital who was sent away only because the father worked in cowsheds

In the case of both scarlet fever and diphtheria there is a continual reinfection of patients whilst in hospital, without the symptoms of the disease, from which they are protected by the original attack. The agents of disease return with the patient, in the throat, either in some degree of attenuation or without any. A transference to a suitable soil is all that is required to restore the full vigour of disease production.

As these are my views, it follows that in my opinion responsibility should rest with medical practitioners who are in charge of the patients, and that that responsibility should not be removed from them. One of the great evils resulting from the present scheme under which National Insurance is worked is, that the practitioners who are in charge of the insured persons have in too many instances more patients on their lists than time in which to treat them properly. This is not, however, a matter for which there is no remedy.

I am, Sir, yours faithfully,
July 13th, 1914. LOVELL DRAGE.

HELIOTHERAPY IN SURGICAL TUBERCULOSIS.

To the Editor of THE LANCET.

SIR,—In THE LANCET of July 11th there appears an annotation on this subject. In it the writer remarks that "in this country a beginning of this method of treatment has scarcely been made."

Heliotherapeutic measures have, however, been employed at the Alton Cripples' Hospital almost since it was opened in 1908, and have always been regarded as an important adjuvant to the more generally recognised methods of conservative treatment of surgical tuberculosis. With increasing experience the value of insolation has become more thoroughly appreciated, and on any sunny weekday a couple of hundred children may at any time be seen receiving carefully graduated treatment in the sunlight. Heliotherapy is undoubtedly of great value in treatment, but its application must be gradually undertaken and requires considerable care. No material benefit appears to be received until pigmentation has been established, and it is interesting to note that in certain patients pigmentation cannot be obtained. Some cases of a pronounced cachectic type resist exposure and will not pigment. In these there is usually abundant evidence of marked tuberculous toxæmia.

Exposure of these patients to sunlight, either natural or artificial, has no beneficial effect whatever, and, indeed, may cause the patient considerable discomfort unless most carefully regulated. In some of these the power to pigment is subsequently acquired, and this pigmentary capacity is not infrequently synchronous with abscess formation and enhanced if the abscess formed is treated by aspiration with or without the injection of modifying fluids. Progress towards recovery is then usually hastened and the complete absorption of the abscess facilitated.

Red-haired patients frequently present great difficulties in treatment. In these the skin reddens and blisters unless great care be taken, and freckles are abundantly deposited, but the desired bronzing is exceedingly difficult to obtain. In the majority of cases, however, pigmentation is produced with comparative ease, and coincident with its establishment there is marked improvement. In no cases of tuberculous arthritis is the improvement more striking than where sepsis complicates the condition, and sinuses, which appear to resist all other methods of treatment, sometimes dry up with remarkable rapidity, leaving supple, non-keloidal, and less unsightly scars. The value of pure, dry air in assisting to obtain these results has, in my opinion, hardly been sufficiently recognised. The functional results which follow insolation of tuberculous joints are often extremely satisfactory, and cases of tuberculous peritonitis and adenitis often derive very considerable benefit. On cloudy days, at Alton, heliotherapeutic treatment is continued artificially with what appears to be the happiest results.

Heliotherapy is an adjuvant to treatment, and as an aid to treatment is of the greatest value, but the indications for its employment and its limitations should be very clearly recognised. It should not displace but should supplement those other well-recognised and valuable methods of treatment summed up by the term "conservative" to which, indeed, it forms an addition of the highest value.

I am, Sir, yours faithfully,

Harley-street, W., July 11th, 1914. H. J. GAUVAIN.

LOCAL ANÆSTHESIA.

To the Editor of THE LANCET.

SIR,—I must thank your reviewer for drawing attention to an overlooked misprint of a somewhat serious nature in my translation of Dr. Arthur Schlesinger's book on "Local Anæsthesia" in THE LANCET of July 11th. Dr. Schlesinger does not, of course, state that inflammatory processes heighten insensibility but the direct reverse—that they heighten sensibility. The statement as it appears in my text is so obviously contrary to experience that most readers will, I fancy, suspect a misprint or a *lapsus calami*.

As regards the other misprint to which your reviewer calls attention, that of supra- for infra-orbital (not the reverse as your reviewer states), it occurs in the original German. I must, however, plead guilty to having overlooked and failed to correct an obvious slip.

I am, Sir, yours faithfully,

Bovingdon, Herts, July 10th, 1914. F. S. ARNOLD.

*** Dr. Arnold is good natured in his willingness to accept responsibility, as translator, for a slip in the original.—ED. L.

THE NATIONAL INSURANCE ACT.

A STATE INSURANCE BILL.

THE Bill introduced in the House of Commons by Sir Richard Cooper, M.P., for which Lord Willoughby de Broke undertakes the responsibility in the House of Lords, has for its main object the institution of voluntary State-aided insurance as a substitute for compulsory insurance. It appears to be somewhat late in the day so far as securing support from the approval of the Friendly Societies is concerned unless the president of the National Conference of Industrial Approved Societies spoke without authority at the meeting held on July 3rd at Staple Inn. He spoke of a scheme of voluntary national insurance as impracticable and impossible in the present circumstances, and said—

> Although many of the leaders of the great Friendly Societies were strongly opposed to the introduction of a compulsory scheme of National Insurance, and cherished with great affection, and rightly so, the voluntary principle on which their societies were based, they have with one accord during the past few weeks denounced the substitution of a voluntary basis for the compulsory basis of the National Insurance Act, not only as impossible, but as unthinkable.
>
> I have said that the voluntary proposition is dead; but I think I may without exaggeration go a step further and say that it is in that yet more parlous condition attributed by a late Conservative statesman to a certain well-known and much-discussed economic doctrine.

There are many others besides Friendly Society officials who have viewed the National Insurance Act in the past with considerable hostility, but are now working hard to make it useful to the nation, and it is doubtful whether any substantial number of these would be in favour of a voluntary system as preferable for the promotion of the national health and well-being. To medical practitioners the clauses of the Bill relating to the administration of benefits by Friendly Societies and trades unions will be of interest, but it will be some time before any such measure introduced by a private Member will be sufficiently within the scope of practical politics for its provisions to demand criticism in detail.

THE PANEL MEDICO-POLITICAL UNION.

A few weeks ago a meeting, to which a selected number of practitioners on the London panel were invited, was held in one of the rooms at the Queen's Hall for the purpose of forming a medico-political organisation for practitioners undertaking the treatment of insured persons. The meeting referred to an executive committee of 12 members (six representing the north side and six the south side of the Thames) the framing of a constitution and rules, and these were submitted to an assembly of 80 practitioners at the Caxton Hall on July 10th. Before this stage was reached, however, the committee summoned a protest meeting of London panel practitioners to consider the attitude of the

London Insurance Committee in the matter of the unallotted funds. The meeting, said to have been attended by 500 practitioners, passed a resolution calling upon the Insurance Committee to distribute; it also appointed a deputation to wait upon the Commissioners and the Government. The reason why only a section of the panel practitioners were invited to the first meeting is said to be that the funds were *not sufficient to enable a circular to* be widely distributed. The promoters seem to have overlooked the possibility of calling the attention of the profession to their proposals through the medium of the medical press; THE LANCET, at any rate, has received no official *intimation* of the various proceedings here related. On July 10th it was decided to call the new organisation the "Panel Medico-Political Union" and to conduct it on trade union principles. Although some doubt appeared to exist in the minds of many of those present, discussion elicited the information that the organisation is not limited to London but is intended to cover the whole country. In view of its basis of election, as representing only the London area, the executive committee undertook to submit itself for re-election at an early date. The subscription was fixed at one guinea a year, membership to be restricted to practitioners on the panel.

Centres for the Coöperation of Panel Practitioners.

The London Panel Committee has given further consideration to the Budget proposals, especially in regard to the grants to be given towards the establishment of centres for the coöperation of practitioners on the panel. The possibilities of the grants being given to hospitals to encourage them to establish smaller institutions in various localities, or, alternatively, of being allotted to groups of panel practitioners, were discussed, and the committee expressed the view that the centres should provide consulting-rooms for a number of practitioners and accommodation for a trained nurse, an X ray operator, and a clerk; that arrangements should be made for the occasional attendance of consultants; and that the centres should be under the joint control of the Insurance and Panel Committees. The committee decided to wait upon the Insurance Commissioners and the Government to discuss the delay on the part of the London Insurance Committee in distributing the funds accumulated during 1913 in respect of insured persons who have not chosen a doctor. The delicate questions that arise in connexion with decisions as to what is or is not extravagant prescribing has led the Pharmacy Subcommittee to express regret that the question of the remuneration of the practitioner is bound up with the cost of the drugs and appliances he orders for his patient. The subcommittee has come to the conclusion that there is much to be said for a variation in the financial arrangements whereby the practitioners' fund and the drug fund are quite independent. The efforts of the Panel Committee would then be directed towards checking extravagant prescribing, not so much that the remuneration of the practitioner should be increased, but in order that the drug fund might be used to secure the greatest benefit to insured persons.

Sheffield Insurance Committee.

At a recent meeting of the Sheffield Insurance Committee dissatisfaction was expressed at the manner in which, it was alleged, certificates were signed by medical men on the panel for the purpose of patients obtaining sickness benefit, The chairman of the Medical Benefit Subcommittee added to this a complaint as to the illegibility of the certificates given, but the principal allegation was to the effect that certificates were frequently signed bearing the words "I have this day examined," when in fact the patient had not been seen by the medical man on that day or even recently. It was pointed out by medical practitioners upon the committee that to give such certificates did not necessarily involve any culpable intention upon the part of a medical practitioner, but it was evidently felt by many present that the practice was prevalent and should be put a stop to. In comment it may be observed that medical practitioners are bound by the Regulations if they undertake to accept service under the National Insurance Act, and that there is no obligation whatever upon them to act otherwise than in accordance with the letter of those Regulations. The infringement of a Regulation may appear to be justified by the apparent interest of a patient, but if Regulations are irksome it is for the patients who suffer from them to protest and to try to get them altered. It is for their benefit that the Act was passed, they contribute to its finances, and they can make their wishes felt through their societies and through the exercise of the parliamentary vote.

Bristol Insurance Committee.

At the last meeting of this committee a resolution was carried in favour of the establishment of medical referees, who shall also act as advisers to the Insurance Committees, a service of trained nurses, facilities for modern methods of diagnosis, and provision for further medical and surgical appliances.

Derbyshire Insurance Committee and Tuberculin Treatment.

At a meeting of the Derbyshire Insurance Committee Mr. J. Court expressed his intention of making public the result of inquiries made by him at dispensaries at which the tuberculin treatment was being administered, in order that the expense of the treatment in relation to the benefit derived from it might be seriously considered. Dr. S. Barwise raised a protest on the ground that as medical adviser to the committee he had not been asked to report on the subject, and pointed out that the institutions referred to were not intended for the purpose of tuberculin treatment. Dr. A. Boswell and the chairman of the Sanatorium Subcommittee also urged that the work being done was still in an experimental stage, that progress was being made, and that criticism was premature. Mr. Court, who assured the committee of his intention to make public the result of his investigations, was invited to print it and present it at a future meeting. At the same meeting of the committee a motion was carried declining to support a movement for the appointment of medical referees to be paid by the State. The question was raised by a letter which had been received from the Kent Insurance Committee asking for such support.

Surplus Funds at Edinburgh.

At a meeting of the Insurance Committee of the burgh of Edinburgh it was resolved after discussion that there should be equal distribution of the funds arising from unallotted insured persons among the medical men on the panel. In the course of the discussion of another proposal, which was negatived, that the money should be allocated in inverse ratio to the number of insured persons on the various lists, a councillor who opposed said that it would give an inducement to medical men to go on the panel and to restrict the number of their patients, knowing that they would so get a handsome sum from the yearly distribution of moneys accumulated. This argument seems to be based upon a misconception, apart from any question of the merits of the scheme against which it was advanced. The large sums which have hitherto been accumulated from the cause indicated have been due to the difficulties arising out of the administration of the Act in its early days. There should never be any such large accumulations again. Now that the Act is everywhere in fair working order, it will be the duty of Insurance Committees to see that newly insured persons either select their medical attendants or are promptly allotted to suitable practitioners. This duty is cast upon the committees by statute, and the Commissioners are sure to see that they perform it.

Medical News.

UNIVERSITY OF OXFORD.—The following medical degrees have been conferred :—

D.M.—G. H. Hunt, Christ Church.
B.M.—A. C. Ballance, A. B. Thompson, T. C. Davies, C. W. B. Littlejohn, and G. P. Selby, New College; and E. E. Mather, Exeter.

EXAMINING BOARD IN ENGLAND BY THE ROYAL COLLEGES OF PHYSICIANS OF LONDON AND SURGEONS OF ENGLAND.—At the Second Professional Examination in Anatomy and Physiology held on July 2nd, 3rd, 6th, and 8th, 83 candidates presented themselves, of whom 49 were approved and 34 were rejected. The following candidates were approved :—

Esawy Ahmed, London Hospital; Douglas Harris Anthony, St. Mary's Hospital; Philip Ardern Ashcroft, Manchester University; Robert Aspinall-Stivala, Guy's Hospital; Youssef Aziz, Cairo Medical School; Percy Banbury, St. Thomas's Hospital; Noel Arthur Hamilton Barlow, Guy's Hospital; Maurice Charles Breese, King's College and St. Mary's Hospital; John Leycester Dudley Buxton, University College; Henry Hutton Castle, St. Thomas's Hospital; Edwin Alfred Clegg, Middlesex Hospital; Antonio Mario Clement, St. Thomas's Hospital; Geoffrey Francis Cobb, St. Bartholomew's Hospital; Cyril John Chesterfield Cooke, University College; Jean Crétin, St. Bartholomew's Hospital; Cyril Lister Curle, Guy's Hospital; Albert Victor Spurgeon Davies, St. Mary's Hospital; Alfred Beresford Dummere, London Hospital; Spencer Graeme Dunn, St. Bartholomew's Hospital; Frederick Oloff Fehrsen, Philip Edward Francis Frossard, and Aziz Girgis, London Hospital; Constance Hart, M.D. Pennsylvania, London School of Medicine for Women; John Anderson Hill, London Hospital; George Hoffmeister, Middlesex Hospital; Frederick Hunter Hyland, Leeds University; Luis Gregorio Chacin Itriago, M.D. Venezuela, Venezuela University and King's College; Mohammed Kamil, King's College; George Spencer Lajus Kemp, Sheffield University; George Edwin Kidman and Kenneth Fergus McAlpin, Guy's Hospital; Maurice William Holt Miles, St. Thomas's Hospital; Joseph Octave Roger Montocchio, Guy's Hospital; Richard Moser, St. Bartholomew's Hospital; William Watson Newton, Birmingham University; Arthur Leslie Packham, L D.S. Eng., Middlesex Hospital; John Alexander Percival Perera, Ceylon and London Hospital; Arthur Rose-Innes, University College; Ahmad Hussein Samy, St. Bartholomew's Hospital; John Andrew Adamson Prinski Scott and Nirendra Mohan Sen-Gupta, London Hospital; John Percy Reginald Tennekoon, Ceylon Medical College; Ismail Tewfik, Cairo Medical School and Guy's Hospital; Kenneth Robert Traill and Walter Aslatt Turner, Guy's Hospital; Percy Ward, Sheffield University; William Harold White, St. Thomas's Hospital; James Harry Wiseman, Sheffield University; and Alfred Frank Wyatt, London Hospital.

At the quarterly examination in Practical Pharmacy held on July 9th the following candidates were approved :—

Edward Beric Alabaster, Birmingham University; Hussein Amin, Cairo and St. Bartholomew's Hospital; George Kilpatrick Arthur, St. Bartholomew's Hospital; Errington Atkinson, London Hospital; Joseph Herbert Bailey, London Hospital; Edgar Richard Batho, St. Mary's Hospital; Alan Gabriel Bodman, Bristol University; Charles Martin Vincent Boucaud, St. Bartholomew's Hospital; Reginald Cade, Guy's Hospital; Percival Cheal, London Hospital; George Edwin Chissell, Middlesex Hospital; Percival Charles Collyns, St. Bartholomew's Hospital; Allen Robert Crane, London Hospital; Thomas Henry Ronald Davies, University College, Cardiff; Lionel Basil Anjou de Kretser and Edmund Rupert Dermer, Middlesex Hospital; Mohamed Ahmed El Dardiri, Cairo and King's College Hospitals; Ahmed Mostafa El-Mishad, Cairo and Charing Cross Hospital; Abdel Hamid El Rakshi, Cairo and St. Bartholomew's Hospital; Tyrrell George Evans, St. Bartholomew's Hospital; Moustafa Fahmy, Cairo and London Hospital; Alfred Foster, St. Bartholomew's Hospital; Abdallah Abd el Rahman Galak, Middlesex Hospital; Edward Francis Gillett, St. Mary's Hospital; Frank Eric Harger, St. Bartholomew's Hospital; Austin George Hewer, Middlesex Hospital; Charles Ewart Hopwood, Manchester University; Eric Llewelyn Ivens, London Hospital; William Anthony Jolliffe, St. Bartholomew's Hospital; Francis Claud Lapage and Guy Neville Lomax, Middlesex Hospital; Albert Victor Lopes, St. Bartholomew's Hospital; James McDonnell, London Hospital; Bagenal Harvey Mellon, F.R.C.V.S., National University, Dublin; Thomas Sidney Nelson, Oxford University and St. George's Hospital; Thomas Owen, St. Bartholomew's Hospital; Christopher Stanley Parker, Charing Cross and King's College Hospitals; Frank Young Pearson, University College, Cardiff; David John Platts, King's College Hospital; John Wootton Rammell and Charles Reginald Recklit, London Hospital; John Harris Ekin Sandford, St. Bartholomew's Hospital; John Milnes Smith, Middlesex Hospital; John Masfen Stack, Birmingham University; Frederick Reginald Sturridge, Middlesex Hospital; Clement Price Thomas, University College, Cardiff; Harry Mortimer Wharry, Oxford University and St. Bartholomew's Hospital; Robert Harvey Williams, St. Bartholomew's Hospital; and Shelsell Yahllevitz, London Hospital.

ROYAL COLLEGE OF SURGEONS OF ENGLAND.—At a meeting of Council of the Royal College of Surgeons of England on July 9th diplomas of Member were conferred upon the following two candidates who have now complied with the necessary by-laws :—

John Robert Mitchell Collie, M.D., C.M. Dalhousie, Dalhousie University and University College Hospital; and Reina Mallet, Royal Free Hospital.

VICTORIA UNIVERSITY OF MANCHESTER.—At examinations held recently the following candidates were successful :—

Diploma in Public Health.—R. B. Berry, G. D. Dawson, James Ferguson, H. M. Fleming, W. M. MacIlraith, James Ramsbottom, E. A. Ramsden, G. K. Thompson, J. A. Tomb, and A. E. Townley.
Diploma in Psychological Medicine.—R. M. Stewart.

UNIVERSITY OF LEEDS.—The degrees of M.B. and Ch.B. have been conferred on the following :—

J. C. Gillies, H. R. Knowles, W. H. Lonen, H. Shochet (with second-class honours), and C. Wilson (with second-class honours).

The following pass-lists have been posted :—

SECOND M.B., CH.B. EXAMINATION.

Part I., Anatomy and Physiology.—E. W. Drury, E. E. V. Glover, K. Jaidka, and I. Silverstein.
Part II., Pharmacy.—Z. P. Fernandez, F. H. Goss, H. V. Horsfall, C. R. Knowles, and A. L. Telling.

FINAL M.B., CH.B. EXAMINATION.

Part I., Pathology and Bacteriology.—J. J. Digges La Touche, H. Hyman, W. L. Ingham, C. Leake, J. Rosenzweig, R. S. Topham, and A. Umanski.
Part II., Forensic Medicine and Public Health.—W. D. Anderson, S. N. Cohen, C. M. Gozney, A. S. Hebblethwaite, H. R. Knowles, H. S. Lockwood, H. W. Whitteron, H. Shochet, J. Wilkinson, and C. Wilson.

L.D.S. EXAMINATION.

First Professional Examination.—A. L. Fraser.
Final Examination (Part I.).—D. B. Clubb and E. A. Rogerson.

The Diploma in Dentistry has been conferred upon J. E. Gill.

UNIVERSITY OF ABERDEEN.—At the graduation ceremony on July 8th the following awards were made :—

Degree of Doctor of Medicine (M.D.).—Alexander Greig Anderson, Alexander Wilson Douglas Craig, William Brooks Keith, James Robertson Murray, William James Reid, Andrew Mackenzie Ross Sinclair, and Francis Wilson Stuart.
Degrees of Bachelor of Medicine (M.B.) and Bachelor of Surgery (Ch.B.).—Neil Cantlie (second class honours), Alexander George Craib, Fergus Macandrew Davidson, John Dow, David Fetter, John Foubister, Rudolf William Galloway, Andrew Moir Gray, Wilfred Francis Hawkins, Alfred James Ireland, George Robertson Lipp (second class honours), Evan Alexander Mackenzie, David Murdoch Marr, James Morrison, John Forbes William Sandison, Ernest Tawse, Walter Bailey Thomson, William Walker, William Robert Watt, and James Mitchell Whyte.
Diploma in Public Health.—Winnifred Margaret Gray and James Henderson Yule.

The Straits Settlements Gold Medal (for best thesis on a subject dealing with tropical medicine) was awarded to Dr. Alexander Frank Wallace. The John Murray Medal and Scholarship (to the most distinguished graduate (M.B.) of 1914) was awarded to Dr. Alexander Elmslie Campbell.

QUEEN'S UNIVERSITY OF BELFAST: FACULTY OF MEDICINE.—At examinations held recently the following candidates were successful :—

FIRST MEDICAL EXAMINATION.

Chemistry and Physics.—Herbert Abernethy, Fredk. C. S. Bradbury, Frederick Campbell, Alfred E. Gallagher, John Grimason, William Hoey, George D. F. M'Fadden, Finlay S. Mayne, Thomas Montgomery, and Albert V. Morrison.
Physics.—Stanley E. Clarke, John W. C. Colquhoun, Alfred J. May, and John D. Pinkerton.
Zoology and Botany.—Herbert Abernethy, Samuel Acheson, Samuel F. Black, Winnifred W. Boland, Frederick C. S. Bradbury, [illegible] Breakey, James H. Calvert, Helen M. Calwell, Frederick Campbell, Thomas G. Campbell, Thomas I. Candy, John Caruth, Gladys [illegible] Chambers, Brice R. Clarke, Joseph M. Clearkin, Thomas D[illegible], Patrick J. Doherty, Samuel E. Duff, Stewart Fullerton, Alfred E. Gallagher, Samuel Hall, Arthur Henry, William Hoey, Mary E. Irwin, Michael G. Kierans, Albert E. Keown, Elizabeth A. K. La[illegible], David Loughridge, Gilbert L. Love, William J. Lytle, Geo. D. F. M'Fadden, John M'Garvey, Daniel J. M'Gurk, Daniel M'[illegible], Robert J. M'Neill, Henry F. Macauley, Edward A. Maguire, Jo[illegible] A. Martin, Finlay S. Mayne, Mary M. Merrick, William M[illegible], Thomas Montgomery, Albert V. Morrison, Samuel Owens, Harry [illegible] Paul, Henry Poston, Richard B. Quinn, W. W. Rentoul, David K. [illegible] Scott, Louis P. St. J. Story, Percival S. Walker, and Arthur Watson.
Chemistry.—David Crombie and Patrick J. Doherty.
Zoology.—James Craig and David Crombie.
Botany.—J. C. Carson.

SECOND MEDICAL EXAMINATION.

Anatomy and Physiology.—Joseph Adams, Samuel T. Allister, David D. Anderson, Olive M. Anderson, Annie E. E. Beattie, James Boyd, Charles [illegible], Gerard J. [illegible], William [illegible], John H. [illegible], Marion Crawford.

Dorothy I. Dobbin, Frederick Hopkins, John Lascelles, Daniel J. Loughran, John C. Loughridge, Robert N. B. McCord, Joseph McCormick, William C. McKee, Jeremiah O'Kane, Charles A. W. Ramsay, John E. Rea, Martin H. Turnbull Norman C. L. B. Tweedie, Thomas Wallace, and Cecil J. A. Woodside.

Physiology.—Olga R. I. Love and Peter Macarthur.

Third Medical Examination.

Pathology and Materia Medica.—William L. Agnew, Eileen M. Bell, William Bryars, *George Chesney*, *Alfred C. Dickey*, Grace M. English, Mary E. Henry, Mary M. Keirns, Arabella C. Kirker, Arthur L. M'Creary (Pathology only), Nathaniel M'Cullough, Joseph P. M'Ginley, Bernard W M'Kinney, Michael M'Menamin, James C M'Millan, Hugh F. M'Nally, Frederick M'Sorley, Patrick J. M'Sorley, John J. Marner, David Mitchell, Frank P. Montgomery, Elizabe'h M. Moore, Margaret S. Purce, William Saunderson, Robert L. Sinclair, Dennis K. Watterson, Donald R. Wheeler, Charles A. Whitfield, and Frederick H. Whyte.

Medical Jurisprudence and Hygiene.—William L. Agnew, George V. Allen, William Bryars, Alfred G. Campbell, George Chesney, Alfred C. Dickey, Samuel J. W. Donald, Grace M. English, Francis Ewart, Mary E. Henry, Louis Jefferson, *Mary M. Keirns*, Arabella C. Kirker, John M. M'Cormack, Nathaniel M'Cullough, Joseph P. M'Ginley, Bernard W. M'Kinney, Michael M'Menamin, James C. M'Millan, David Mitchell, Elizabeth M. Moore, William Napier, Margaret S. Purce, Robert J. Rea, John Scott, *Robert J. Sinclair*, *Thomas R. S. Thompson*, Donald R. Wheeler, Charles A. Whitfield, Frederick H. Whyte, John Wilson (Old Regulations), and James J. Thompson.

At the examination for M.B., B.Ch., and B.A.O. degrees, the following were successful:—

Robert M. Beath (First Class), Herbert T. Chatfield, William M'M' Chesney, John Duffin, Edward C. T. Emerson (Second Class), Archibald Fullerton (Second Class), David Gaston, Margaret Gorman, Thomas Grimson, William S. B. Hay (Second Class), Joseph F. D. Hunter, David Jamison, William J. Lascelles, Beattie Lyons, Campbell M'N. M'Cormack, Robert N. M'Kinstry, Edward U. MacWilliam, Edward A. Mallon, Edward B. C. Mayrs (Second Class), Sinclair Miller (Second Class), James J. Murray, Samuel E. Picken, George R. B. Purce (Second Class), George W. Rea, Elizabeth M. Robb, John S. Savage, Albert F. L. Shields, James Tate, John Warwick, *Owen Wilson*, William R. E. Wilson, and Peter P. Wright.

The following degrees and diplomas have been conferred:—

M.D.—By Thesis: David Finnegan, Philip Jacob Gafikin, David M'Cay (gold medal), Samuel M'Clure, William Samuel J. Shaw, and John M'Geagh Williams. By Examination: Bruce A. West (with commendation).

M.Ch.—By Examination: T. S. S. Holmes (gold medal). By Thesis: Frederick Crooks.

Diploma in Public Health.—Marion B. Andrews, Norman C. Graham, William S. Haydock, William J. F. Mayne, and Samuel P. Rea.

TRINITY COLLEGE, DUBLIN: SCHOOL OF PHYSIC.—At examinations held recently the following candidates were successful:—

Preliminary Scientific Medical Examination.

Chemistry and Physics.—A. G. Bewley, R. P. Hemphill, T. M. Bentley, F. Gill, R. M. D. Devereux, P. C. Parr, L. Albertyn, J. F. Stewart, E. E. Rollins, J. W. Scharff, J. Posner, E. B. Edge, W. F. McConnell, J. M. Semple, E. F. Wilson, T. H. R. McKiernan, J. M. Hill, J. H. B. Levis, J. A. Acheson, T. S. McDonald, D. McElwee, J. C. Fouche, J. N. H. Murphy, T. B. H. Tabuteau, J. C. Campbell-Henry, P. C. Cowan, N. Gray, and S. W. Russell.

Botany and Zoology.—R. P. Hemphill, L. Albertyn, J. A. Acheson, P. G. Lewis, E. F. Wilson, Gertrude Rice, W. B. Briggs, S. A. Clark, W. L. Lloyd, W. L. Young, G. H. Davis, J. W. Scharff, S. W. Russell, E. B. Edge, A. H. Thompson, C. W. Parr, H. A Lavelle, R. M. D. Devereux, W. F. McConnell, J. E. McCormick J. H. Coolican, T. Madill, J. F. Stewart, E. F. W. Smith, H. Birney, E. S. E. Mack, E. E. Rollins, I. W. Beatty, A. Blagoff, T. R Warren, R. N. Nunn, H. J. Wright, G. C Robb, W. Sweetnam, C. D. Shortt, P. Casey, F. W. Godbey, W. A. Shannon, S. J. Laverty, G R. G. Smyth, and J. D. Watson.

Botany.—J. M. Hill.

Intermediate Medical Examination.

Part I.—E. D. McCrea, W. R. Fearon, B. A. McSwiney, A. R. Barlas, A. L. Gregg, R. N. Murray, J R. Duggan, W. P. Elford, W. H. Flinn, S. C. Mitchell, J. J. Beasley, W. P. Lubbe, F. J. Smith, C. P. Chambers, G. W B. Shaw, P. S. Snell, W. J. McClintock, R. W. Nesbitt, C. L. McDonogh, A. H. Davidson, F. C. Tucker, M. C. Dippenaar, H. H. Molloy, F. G. Heuston, and J. McClelland.

Part II.—T. J. Lane, S. V. Furlong, S. R. Hill, J. P. Macnamara, E. Parker, F. J. Murphy, J. T. Westby, F. M. Ferguson, F. A. McHugh, B. A. Merrin, J. J. Keatley, R. Gordon, and G. L. Murphy.

Final Medical Examination.

Part I.—H. Daniel, E. D. T. Hayes, J. W. Bigger, R. W. Shegog, G. Joughin, Violet M. Deale, G. O. F. Alley, D. S. Martin, *H. Mitchell*, W. F. Wilson, A. F. Grimbly, T. Stanton, A. J. Horne, E J. Hamilton, R. W. Acheson, D. H. Hall, A. L. Wilson, and W. J. Dowling. *Materia Medica and Medical Jurisprudence.*—F. W. O'Connor and T. G. Roche. *Pathology.*—W. B. Walker

Part II.—*Medicine.*—J. N. Armstrong, P. W. McKeag, G. H. Wood, F. J. O. King, T. D. Power, H. C. D. Miller, J. C. A. *Dowse*, C. O. M. Buckley, W. A. Ryan, Dorothy E. Webb, F. A. Reddy, H. R. Ford, T. A. Lauder, W. H. Elliott, W. O. Tobias, Amy F. Nash, J. S. Dockrill and J. H. Fletcher. *Surgery.*—J. C. A Dowse, E. E. Lary, J. C. Ogilvie, J. P. Quinn, T. W. Allen, E. Evans, F. S Mitchell, C. D. M. Buckley, R. I. Sullivan, A. G. Varian, W. R. L. Waters, J. H. Fletcher, G. H. Wood, F. R. Dougan, N. H. H. Haskins, B. C. O. Sheridan, W. O. Tobias, F. J. O. King, J. N. Armstrong, H. B. Ford, R. A. Anderson, and W. M. Snodgrass.

Midwifery.—N. M. Boyce, W. E. Tyndall, R. R. G. Atkins, J. S. Robinson, E. Robinson, F. Harris, J. V. Cope, H. S. Collins, Clara B. M. Adderley, W. B. Cathcart, and W. M. Snodgrass.

Dental Examinations.

Preliminary Scientific.—*Chemistry and Physics.*—H. E. Flavelle and J. H. J. Stuart. *Chemistry.*—L. Wigoder. *Dental Anatomy.*—H. E. Flavelle.

Intermediate.—M. L. Counihan and C. H. Herbert.

Diploma in Public Health.

Part I.—J. R. D. Holtby, E. O'Connor, A. V. J. Richardson, H. T. S McClintock, and K. L. Kapur.

Part II.—A. V. J. Richardson, G. H. Culverwell, K. L. Kapur, R. H. C. Lyons, E. O'Connor, and H. T. S. McClintock.

CONVERSAZIONE AT THE ROYAL COLLEGE OF PHYSICIANS OF LONDON.—In connexion with the final meeting of the organising committee of the Seventeenth International Congress of Medicine, held in London last year, a reception was given at the Royal College of Physicians of London on July 7th, when the guests were received by Sir Thomas and Lady Barlow. There was a large attendance. A fine display of books, including early editions, and manuscripts of Harvey and Sydenham, was arranged by Dr. Norman Moore, the Harveian librarian, an interesting collection of plate in the possession of the College was shown, and a loan collection of water-colours, etchings, and drawings was exhibited. In the evening Mr. Stephen Paget showed some kinematograph films illustrating the life of micro-organisms.

ROYAL DENTAL HOSPITAL OF LONDON: SCHOOL OF DENTAL SURGERY.—A series of post-graduate lectures will be given as follows during the months of October and November, 1914, on Tuesdays, at 6 P.M. Oct. 13th: Recent Researches in Dental Histology, by Mr. J. H. Mummery. Oct. 20th: Advantages and Disadvantages of Inserting Dentures immediately after the Multiple Extraction of Teeth, by Mr. H. Lloyd Williams. Oct. 27th: Ultimate Results of the Immediate Regulation of Misplaced Teeth, by Mr. W. H. Dolamore. Nov. 3rd: Gum Facings, by Mr. D. P. Gabell. Nov. 10th: Some Uses of Casting, by Mr. W. W. James. Nov. 17th: The Extraction of Teeth, by Mr. A. L. Whitehouse. The fee for the course is £2 2*s.*, but past and present students of the hospital and internal students of the University of *London* will be admitted free.

ROYAL MEDICAL BENEVOLENT FUND.—At the last meeting of the committee 24 cases were considered and grants amounting to £185 voted to 22 of the applicants. The following is a summary of the cases relieved:—

M.R.C.S., L.R.C.P., aged 47, who practised at Aysgarth, Yorks, and abroad. After residence abroad health broke down and had to return to England, thoroughly incapacitated and still unable to work. Voted £10 in two instalments.—Widow, aged 65, of L.S.A. Lond. who practised at Ipswich. Five children; three married but unable to help. Only income £8 per annum from life assurance and 1*s.* per week from lodgers. Health not good. Relieved 12 times, £130. Voted £10 in ten instalments.—Daughters, aged 48 and 56, of M.D. Aberd. who practised at Luddenden, Yorks. The eldest is suffering from incurable deafness and the younger one has very indifferent health. Only income £20 each per annum from investment. Relieved once, £10. Voted £10.—Widow, aged 58, of L.R.C.P. & S. Edin. who practised at Balham and died in 19 3. Invested small capital in furnishing house *to receive* paying guests, but has lost money. Voted £12 in 12 instalments.—Widow, aged 39, of L.R.C.P. & S. Irel. who practised in Monmouthshire and New South Wales. Engaged as housekeeper at £15 12*s.* per year, and one of two daughters, aged 10 years, is allowed to live with her. The other child adopted by husband's relatives. Asks for assistance towards the education of daughter. Voted £2 and referred to the Guild.—Widow, aged 64, of M.R.C.S. Eng. who practised in Birmingham, Brighton, and Australia. Lost all capital in consequence of husband's long illness 11 years ago. Only settled income £10 per annum, and too old to obtain work. Voted £12 in 12 instalments.—Widow, aged 53, of L.R.C.P. & S. Edin. who practised at Great Yarmouth. One daughter, who used to dispense for her father, but now helps her mother and does other work. Invested capital in boarding house which has not paid. Voted £12 in 12 instalments.—*Widow*, aged 46, of L.S.A. Lond. who practised at Leyton. Five daughters, eldest 16 years. No provision made for the widow, and her only income is a small allowance made by her brothers. Voted £2 and referred to the Guild.—M.B. of Aberdeen, aged 55, who practised at Bunbury and in Essex. Suffering from paralysis and quite unable to work. Wife and four daughters, two of whom are at school. Only income £76 per annum from investments and small pension. Voted £5 and referred to the Guild.—Widow, aged 32, of M.R.C.S. Eng. who practised at Keyingham, near Hull. Three children, the eldest 9 years. Only income £12 per annum. Voted £10 in two instalments.—Daughter, aged 43 of L.R C.P. & S. Edin. who practised at Easdon and Whitley Bay. Obtains a small income by nursing, but has been unable to work for 11 weeks owing to sciatica. Relieved nine times, £60. Voted £5.—Daughter, aged 62 of M R C.S. Eng who practised at Lydney. Means lost through a defaulting trustee, and too old to work. Only income an annuity of £21 from another charity Relieved seven times, £77 Voted £5—Widow, aged 56 of M R C S. Eng who practised at Enfield. Two daughters, one married and the other an invalid. Income only £60 per annum, and not well enough to work. Relieved three times, £15. Voted £5.—Widow, aged 49, of L.S.A. Lond. who practised at Leicester. Earns a little by needlework, but cannot obtain sufficient work. Two daughters, each only earning a little, and two boys, ages 12 and 10, at school. Relieved twice, £22. Voted £12 in 12 instalments.—Widow, aged 55, of L.R.C.P. & S. Glasg. who practised at Heaton-on-Tyne. Six children, two of whom are married and unable to assist, and the others only very little. Has two lodgers. Health very unsatisfactory. Relieved ten times, £106. Voted £12 in 12 instalments.—Daughter, aged 50, of M.R.C.S. Eng. who practised at Box. Lives with delicate sister, who also receives a grant from the Fund. Applicant's health very unsatisfactory. Relieved twice, £24. Voted £12 in 12 instalments.—Widow, aged 62, of M.D. Edin. and M.R.C.S. Eng. who practised at Cambridge. Income £25 per annum from friends and occasionally has a boarder. Relieved four times, £24. Voted £12 in 12 instalments.—Widow, aged 56, of M.R.C.S. Eng. who practised at Wellingborough. No income of own, but acted for a time as housekeeper for relative who gave home and board in return. The home has now been given up, so is stranded. Relieved three times, £32. Voted £12 in 12 instalments.—Widow, aged 34, of M.R.C.S. Eng. who practised at Bow, E. Endeavours to make a living by taking in boarders, but not very successfully, and is in arrears with rent. Has twin boys aged 7½ years. Relieved once, £10. Voted £10.—Special emergency grants of £5 each were also made to two cases, these to be given at the discretion of the honorary secretary for cases.

Contributions may be sent to the honorary treasurer, Dr. Samuel West, 11, Chandos-street, Cavendish-square, London, W.

Parliamentary Intelligence.

NOTES ON CURRENT TOPICS.

Infant Mortality in Lancashire.

THERE has been presented to Parliament a report dealing with infant mortality in Lancashire. It has been prepared by the medical officer of the Local Government Board and by Dr. COPEMAN, Dr. MANBY, Dr. FARRAR, and Miss LANE-CLAYPON, M.D.

St. George's Hospital Act.

The Royal assent has been given to the St. George's Hospital Act, which has passed both Houses of Parliament during the present session.

The Midwives (Scotland) Bill.

The Midwives (Scotland) Bill has been read a second time in the House of Commons and sent to a Standing Committee.

Experiments on Living Animals.

On the motion of Mr. ELLIS GRIFFITH the House of Commons has ordered a return showing the number of experiments on living animals during the year 1913, under licences granted under the Act 39 and 40 Vict., c. 77, distinguishing the nature of the experiments.

The Milk and Dairies Bill.

The Standing Committee of the House of Commons which has been considering the Milk and Dairies Bill has concluded its examination of that measure and has ordered it to be reported with amendments to the House.

Forcible Feeding.

A deputation from the Forcible Feeding Protest Committee, consisting of Dr. J. MCINTOSH, Dr. HADEN GUEST, Sir VICTOR HORSLEY, Mr. C. MANSELL MOULLIN, Dr. FRANK MOXON, and Dr. H. SCHÜTZE, waited upon the Home Secretary on July 15th. Mr. MCKENNA intimated that on the ground of the undesirability of the publication of prisoners' names reporters would not be admitted. Neither would he permit the deputation's own shorthand writer to be present, but mentioned that he had an official reporter in attendance. The deputation replied that it could not accept this position, and remarked that the names of the prisoners had already been widely published. The position of the deputation was one of grave public responsibility, and they demanded to be heard in the presence of the press. The deputation then withdrew, and from the Westminster Palace Hotel issued a statement upon which the above relation of the facts is based.

HOUSE OF COMMONS.

THURSDAY, JULY 9TH.

Physical Instruction in Elementary Schools.

Mr. KING asked the President of the Board of Education whether physical exercises were a compulsory part of the curriculum in public elementary schools; and whether he would cease to recognise any school which failed to provide for physical instruction in accordance with the code.—Mr. J. A. PEASE answered: Physical training is one of the subjects mentioned in Article 2 of the Code. The article states, however, that it is not necessary for all the subjects mentioned to be taught in every school or class. The importance which the Board attach to instruction in this subject is shown in the introduction to the syllabus of Physical Exercises. In view of what is said there, I think it would be very difficult to satisfy the Board that at any particular school physical training is not required by the needs of the scholars. I am not aware of any school in which physical training is not now included in the curriculum, though its efficiency and adequacy vary considerably.

Sight Tests in the Mercantile Marine.

Mr. LYNCH asked the President of the Board of Trade how many of those rejected for colour blindness, as indicated in the last report, failed with the lantern but passed the wool test and vice versa, and whether he would consider the advisability of giving this information in the reports in future.—Mr. BURNS said in reply: I assume this question refers to the sight tests used in the mercantile marine. 138 candidates passed the wool test and failed in the lantern test. Of these 24 subsequently passed on appeal, and thus 114 finally failed. 101 candidates passed the wool test and in the lantern test were "referred" for further examination. At the latter examination 76 passed and 25 failed. No candidates failed in the wool test and passed in the lantern test. Three candidates were "referred" in the wool test and passed the lantern test, all three subsequently passing a special examination. The number of candidates who pass, fail, or are "referred" in the lantern or wool tests respectively will be given in the next return as suggested. I should add that "referred" means that the candidate was not definitely passed or rejected, but was referred to London for a special examination.

Mr. LYNCH: Will the right honourable gentleman bring a scientific spirit to bear on this question, so that the wool test may be altogether eliminated?—Mr. BURNS: The honourable gentleman is rather belated in his suggestion. The old form of wool test has been abandoned. I had the pleasure of taking the objectors to and the critics of the wool test down to Shoeburyness, and after a pleasant night on the marshes the objectors were silenced and the critics satisfied.

Housing Department at the Local Government Board.

Answering Mr. LANE-FOX, Mr. HERBERT SAMUEL (President of the Local Government Board) said: There is a special department of the Local Government Board which deals exclusively with housing and town planning questions. The department consists of 23 officials, in addition to a staff of eight inspectors whose time is wholly devoted to this work. The services of the Board's technical officers in the medical, engineering, and architectural staffs are also partly given to housing questions.

Sanitary Conditions in the Mercantile Marine.

Mr. BURNS (President of the Board of Trade), replying to various points that had been raised in Committee of Supply on the Board of Trade estimates, said that the department was justified in the present sight test and meant to adhere to it. Several honourable Members had referred to the sanitary condition of ship accommodation, hospitals on ships, crew space, and similar things. He found that whereas there had been a striking diminution in the death-rate in the Royal Navy and the army and also amongst the industrial population in the years from 1891 to 1911, there had been practically no diminution in the deaths from disease in the mercantile marine. He had appointed a small committee of specialists, with medical officers, statistical experts, and others, to examine the whole subject of the mortality in the mercantile marine, and he hoped soon to have from the committee a practical and suggestive report. He was glad to say that on the subject of hospital accommodation for crews much had been done. In January, 1912, the Board of Trade issued a notice to shipowners that in cargo vessels suitable accommodation should be provided for sick and disabled seamen. Of 150 large vessels built in 1902 there were only 10 with crew hospitals, or 7 per cent.; of 160 built in 1912, 28, or 17 per cent., had crew hospitals provided; of 213 built in 1913, 68, or 32 per cent., were provided with crew hospitals. The Board intended by every means in its power to accelerate the provision of hospitals not only on emigrant ships and large steamers but on a large number of tramp steamers, where the men perhaps required hospital accommodation more than on the great liners.

MONDAY, JULY 13TH.

The Drug Fund.

Mr. GODFREY LOCKER-LAMPSON asked the honourable Member for St. George's-in-the-East, as representing the Insurance Commissioners, whether the Government could now make any announcement in regard to the Insurance Committees which had deficiencies on the drug fund in respect of the year ending January, 1914; what the approximate amount of the deficiency was in each case; and whether the Government proposed to make a grant so that the panel chemists might get paid for the drugs they had supplied on the doctors' orders.—Mr. WEDGWOOD BENN replied: For the reasons already given in my previous replies I am unable to make any general announcement as to the position with regard to any deficiencies for the year 1913. The rest of the question does not accordingly arise.

Sickness Claims under the Insurance Act.

Mr. FRED HALL (Dulwich) asked the Prime Minister whether, in view of the consideration raised by the recently published annual report of the National Health Insurance Commissioners as regarded the financial position of the Approved Societies, the position of deposit contributors, the excessive claims of women, and the bearing of the question of unemployment upon the operation of health insurance generally, he would consider the appointment of a special committee to inquire into the working of the Act as a whole, with a view to formulating comprehensive proposals for its amendment in the light of the experience now available; and whether in the meantime he would postpone any proposal for amendment or limit such proposals to matters of detail which would not admit of delay.—Mr. ASQUITH answered: A special committee appointed last autumn has been examining the whole question of sickness claims under the Insurance Act, and will, I am informed, report shortly. The Chancellor of the Exchequer has already announced that the Government propose to deal with these questions by such means as experience has proved desirable.

TUESDAY, JULY 14TH.

Exemptions from Vaccination.

Mr. NORMAN CRAIG asked the President of the Local Government Board what were the percentages of exemption from vaccination for the years 1906 to 1913 inclusive.—Mr. HERBERT SAMUEL wrote in reply: The figures are as follows:—

Year.	Number of births registered during the year.	Number of exemptions received during the year.	Percentage of statutory exemptions.	Percentage of children ultimately unvaccinated.
1906	935,081	52,391	5·6	16·8
1907	918,042	57,675	6·3	20·4
1908	940,383	162,729	17·3	27·9
1909	914,472	190,689	20·9	32·3
1910	896,952	230,947	25·7	36·3
1911	881,133	248,483	28·2	38·9
1912	872,767	275,929	31·6	42·9
1913	881,490	308,235	35·0	Figures not available.

The Local Government Board receive, in February of each year, returns from all vaccination officers relating to the children born within the previous year but one. These returns show the numbers of such children who have been vaccinated, or found insusceptible of vaccination, or have had small-pox, or have died. The percentages in the last column are based on the numbers of children remaining after the deduction of these classes.

The Work of Sir Ronald Ross.

Mr. COWAN asked the Chancellor of the Exchequer whether he had received a petition to the House from Sir Ronald Ross, K.C.B., F.R.S., asking for compensation for loss in his profession incurred through his long-continued investigations on malaria; whether the petition was based upon the precedents of similar petitions successfully submitted to the House by Dr. Edward Jenner in 1802 and again in 1807, and by George William Manby in 1823; and whether he would recommend Sir Ronald Ross's petition, as required by Standing Order 66, in order to enable it to be laid before the House.—Mr. LLOYD GEORGE replied: I have received the petition referred to, but I have not felt justified in taking the course suggested, which is not in accordance with modern usage.

Notification of Births.

Mr. ALDEN asked the President of the Local Government Board whether, in order to assist the working of the Notification of Births Act, he had any objection to the superintendent registrars handing to the parents who attended to register a birth a notice containing a short reference to the provisions of the Act, and, if he had no such objection, whether he could see his way to issue a circular to the various superintendent registrars calling their attention to the matter.—Mr. HERBERT SAMUEL said in reply: In view of the fact that the notification under the Notification of Births Act has to be given within 36 hours of the birth of a child, while a period of six weeks is allowed for registration, I fear that the advantage of adopting my honourable friend's suggestion would not compensate for the additional trouble caused.

BOOKS, ETC., RECEIVED.

BAILLIÈRE, TINDALL, AND COX, London.

Sleeping Sickness in the Island of Principe. By Surgeon-Captain B. F. Bruto da Costa, Health Officer and Chief of the Sleeping Sickness Commission. Translated by Lieutenant-Colonel J. A. Wyllie, F.R.G.S., Indian Army (retired).

WREXHAM INFIRMARY.—Resident House Surgeon. Salary £120 per annum, with board, lodging, and washing.

YORK COUNTY HOSPITAL.—House Physician for six months. Salary at rate of £100 per annum, with board, residence, &c.

THE Chief Inspector of Factories, Home Office, London, S.W., gives notice of vacancies for Certifying Surgeons under the Factory and Workshop Acts at East Newcastle, in the county of Northumberland; at Maiden Newton, in the county of Dorset; and at West Newcastle, in the county of Northumberland.

Births, Marriages, and Deaths.

BIRTHS.

PAGE.—On July 10th, at Old Market-street, Bristol, the wife of Lionel Page, M.R.C.S. Eng., L.R.C.P. Eng., of a son.

WILLIAMS.—On July 7th, at Lansdowne-road, Clapham, the wife of Cyril Williams, M.R.C.S., L.R.C.P., of a daughter.

MARRIAGES.

COLE—BRIDGMAN.—On July 4th, at St. Olave's, Finsbury Park, N., John William Edward Cole, M.B., to Caroline Fanny Bridgman, widow of the late Herbert Bridgman, Esq., L.S.A.

DE BRENT—DAWS.—On July 7th, at St. George's Church, Catford, Harold John de Brent., M.R.C.S., L.R.C.P., to Elsie, third daughter of J. E. Daws, Esq., of Bournemouth.

HICKS—JAMES.—On July 8th, at Holy Trinity, South Hampstead, by Rev. Arthur Griffiths, John Athelstan Braxton Hicks, M.D., M.R.C.P., only son of the late A. Braxton Hicks, H.M. Coroner, and Mrs. A. Braxton Hicks, 5A, Perham-road, W., to Adeline Stephanie, daughter of the late Wm. Lamprey James, Esq., of Exeter, and Mrs. Hall, of Westcliff-on-Sea.

DEATHS.

ASHWORTH.—On July 12th, at Vigne House, Cliftonville, Margate, Kate, wife of J. Henry Ashworth, M.D. St. And., M.R.C.P. Edin.

PITT.—On July 10th, at Great Somerford, Chippenham, Charles Wightwick Pitt, M.R.C.S., L.S.A., aged 71.

N.B.—A fee of 5s. is charged for the insertion of Notices of Births Marriages, and Deaths.

Notes, Short Comments, and Answers to Correspondents.

HEALTH OF BARBADOS.

A REPORT on the Barbados Blue-book for the year 1912–13, prepared by the Acting Colonial Secretary, Mr. W. L. C. Phillips, has just been issued. It gives the estimated population of the colony as 172,203—71,641 males and 100,562 females. The birth-rate was 35·8 per 1000 as compared with 35·2 the previous year, and the death-rate 41 per 1000 as against 26·3. There was an increase of 2505 in the number of burials, and as there was no outbreak of quarantinable disease, that increase is attributed to the privation consequent on the drought experienced throughout 1912. Illegitimate births numbered 3799, or 59·6 per cent., of the total births. The number of burials of children under one year of age was 2642, a rate of 416 per 1000, as against 263 in 1911 and 268 in 1910. The average maximum temperature for the year 1912 was 84·3° F. and the average minimum 75·7°. The average rainfall for the island for the year from 145 stations was 41·49 inches, as compared with 59·28 inches from 154 stations for the previous year, and with 61·51 inches from an average of 120 stations for the 65 years ended 1912. The rainfall in Barbados is extremely localised as regards distribution over the island. In England it is possible to describe several counties in the daily returns of rainfall. In Barbados, however, there would be notable inaccuracy even if the description was limited to parishes, because the clouds are so capricious that while one planter is looking at a rapidly filling rain gauge with chuckling contentment, a neighbour may be alluding—with a planter's emphasis—to the rainless sunshine which threatens to make his pocket absolutely empty. This characteristic applies as well to those parishes which are flat and without hills as to those which are of an entirely hilly character and to those which contain both flat lands and hills. Cases frequently occur where, in adjoining plantations of a few hundred acres each in the same parish and with the same natural features, one will be abundantly watered and the other remain dry. A recent case may be cited where in three adjoining plantations in St. Peter's parish the precipitation of rain on one was four inches, while in each of the adjoining properties the precipitation was only four-hundredths of one inch. There are no woods or forests in the island which in other places may account for differences occurring in the rainfall, and no explanation of the peculiarity can be found in natural causes. Mention has been made of the drought of 1912. It caused a decrease in the revenue and a decrease in the trade of the colony, as well as a practical failure of the provision crops, with resulting high prices for imported foodstuffs, increasing the cost of living for all classes. It diminished the wage-earnings of the people and swelled the ranks of the recipients of poor relief; it increased the number of criminals, brought many to the verge of starvation, and, most serious of all, it was the undoubted cause of the very high increase in the death-rate. The subject cannot be discussed without referring to the admirable spirit of fortitude and patience displayed by the people in their sufferings.

"ADVT."

To the Editor of THE LANCET

SIR,—A few weeks ago I drew your attention to a medical man's announcement in the Court Circular of a daily newspaper. Here is another example from to-day's paper:—

> *Dr. H——*, on his return to practice, desires to thank his many friends who kindly inquired after him during his recent illness.

I suggest that the letters "Advt." ought to be added in such cases.

I am, Sir, yours faithfully,

July 13th, 1914.

P. R. N.

FAITH-HEALING COMBINED WITH DRUGS.

AN inquest recently held by Mr. R. Kemp at Hounslow on the body of Miss Kate Addison Scott showed, as the coroner observed at its conclusion, the extraordinarily easy way in which members of the public are "taken in by quasi-religious faith-healers." The deceased, who had long suffered from a nervous complaint and was paralysed, had entered the house kept by a man named Orlando Edgar Miller, a person without medical qualifications, who described himself at the inquest as a "teacher, lecturer, and healer." There she paid 5 guineas a week, and received treatment which combined "the laying on of hands and giving the right heart," injections, cascara, and scopolamine.

Dr. H. L. Wilson, who had before attended the deceased, was eventually called in and found her moribund. His evidence was supplemented by that of Dr. L. B. Christian and Dr. W. H. Willcox, but neither of these gentlemen was able to say that death was due to, or had been accelerated by the use of, scopolamine. A verdict was returned ascribing it to natural causes, with a request from the jury to the coroner that he should severely censure Miller for administering a dangerous drug which might have accelerated death.

HEALTH AND SANITATION IN SOUTHERN NIGERIA.

A REPORT on the Blue-book for the Colony and Protectorate of Southern Nigeria (which is now in course of amalgamation with Northern Nigeria under the governorship of Sir F. Lugard) has been received at the Colonial Office and ordered by His Majesty to be presented to both Houses of Parliament. It states, *inter alia*, that the native population is estimated at approximately 7,856,000, divided in the three provinces as follows: Western Province, 2,151,000; Central Province, 2,403,000; Eastern Province, 3,297,000. The European population consists of 760 Government officials and 1030 non-officials. During the year 1912 there were 26 deaths and 32 cases of invaliding among European non-officials, and 9 deaths and 57 invalidings among Government officials. At Lagos Hospital (Western Province) the out-patient department was attended by 5236 persons, (Europeans and natives), whilst the in-patient department treated 2218. Minor and major operations were performed to the number of 353. In the Yaba leper asylum 23 cases were treated and there was one death. In the Central Province the out-patients at Onitsha Hospital numbered 5291 and at Warri Hospital 5489; the in-patients at the former totalled 1090 and at the latter 72. 372 in-patients (of whom 24 died) were treated in the native hospital. In the Eastern Province 2 cases received treatment at the Opobo European Hospital, whilst at the Calabar Hospital 8056 out-patients sought treatment, and there were 132 in-patients (with 5 deaths) treated in the European wards and 1194 (with 70 deaths) in the native wards. An outbreak of dysentery and an epidemic of chicken-pox occurred in Calabar Prison. During the year 1912, owing to the increased interest in the work by all concerned, and more especially to the frequent and thorough visits to most of the European stations and large native towns by sanitary officers, the sanitation of the Colony and Protectorate showed a decided change for the better. The matters of water-supply, disposal of refuse and night-soil, prison ventilation and accommodation, the housing of Europeans, and the mosquito-proofing of houses received special attention. The progress of sanitation has been greatly facilitated by (*a*) the employment of European sanitary inspectors, who have been posted in the more important centres, and an increase in the number of native inspectors; (*b*) the framing or alteration of Ordinances and Orders in Council with regard to public health matters; (*c*) the prosecution of an active anti-mosquito campaign; (*d*) the adoption of sanitary schemes suited to various large centres; (*e*) the erection of new infectious diseases hospitals; (*f*) better provision for fumigation and disinfection of buildings, &c.; (*g*) a more thorough and systematic inspection of the railway; and (*h*) the reclamation of swamps.

URINE-COLLECTING BOTTLES.

U.C.B. writes: I think I remember seeing some description in one of the medical journals of urine-collecting bottles a little time ago. I think a part of the surface of the bottle was ground rough for writing on with pencil. I should be much obliged if any of your readers could give me a reference.

DRAWINGS OF ST. BARTHOLOMEW'S HOSPITAL.

OLD St. Bartholomew's men in all parts of the world will be pleased to learn that Mr. Hanslip Fletcher, whose sketches of Guy's and King's College Hospitals have been widely appreciated, has now published through Messrs. W. H. Beynon and Co., St. Alban's Lodge, Cheltenham, a series of plates illustrating their hospital. This consists of eight replicas of wash drawings made recently at St. Bartholomew's Hospital, and the subjects are as follows: King Henry VIII. gateway; bird's-eye view of the Smithfield entrance; the square; the fountain; the medical school buildings; the staircase to the great hall; the Church of St. Bartholomew the Less; and the Church of St. Bartholomew the Great. The last-named, which is an interior view, showing the tomb of Rahere, is charmingly reproduced in colour; the remainder are in monochrome. The size of the plates, including margin, is 17 inches by 13 inches, and the subscription price for artist's signed proofs on Japanese paper is 2 guineas the set. Those specimens which we have seen are very well designed and reproduced, and give a good idea of scenes which are familiar to all who have worked in the hospital. Mr. Hanslip Fletcher is particularly happy in his treatment of such architectural subjects.

THE PORT OF LONDON.

THE Port of London Authority, 109, Leadenhall-street, London, E.C., has issued an interesting volume dealing with the past and present history of the Thames and its docks. The letterpress is by Douglas Owen and the illustrations are by Charles J. De Lacy. The book briefly traces the rise of the Port of London from its earliest days, and relates the circumstances which eventually led up to the creation of the Port of London Authority, while it deals fully with the great scheme of improvements now in course of execution.

RARE MEDICAL BOOKS.

WE have received from Messrs. Funk and Wagnalls Company, of Salisbury-square, London, E.C., an illustrated catalogue containing many interesting medical items. This firm offers to send a copy gratis to any of our readers who make application for it.

COMMUNICATIONS not noticed in our present issue will receive attention in our next.

Medical Diary for the ensuing Week.

LECTURES, ADDRESSES, DEMONSTRATIONS, &c.

MEDICAL GRADUATES' COLLEGE AND POLYCLINIC, 22, Chenies-street, W.C.

MONDAY.—4 P.M., Dr. H. C. Semon: Clinique (Skin). 5.15 P.M., Lecture:—Dr. W. C. Topley: Laboratory Aids to Diagnosis in Obscure Febrile Cases.

TUESDAY.—4 P.M., Dr. E. B. Smith: Clinique (Medical). 5.15 P.M., Lecture:—Mr. A. Edmunds: Abdominal Pain.

WEDNESDAY.—4 P.M., Mr. E. C. Hughes: Clinique (Surgical). 5.15 P.M., Lecture:—Sir W. Arbuthnot Lane, Bart.: Fractures.

THURSDAY.—4 P.M., Dr. C. O. Hawthorne: Clinique (Medical). 5.15 P.M., Lecture:—Dr. E. Wynter: Herpes.

FRIDAY.—4 P.M., Mr. E. D. Davis: Clinique (Ear, Nose, and Throat). 5.15 P.M., Lecture:—Dr. W. Wingrave: The Pathology of Warts.

POST-GRADUATE COLLEGE, West London Hospital, Hammersmith-road, W.

MONDAY.—10 A.M., Dr. Simson: Diseases of Women. 10.30 A.M., Medical Registrar: Demonstration of Cases in Wards. 12 noon, Dr. Bernstein: Pathological Demonstration. 2 P.M., Medical and Surgical Clinics. X Rays. Mr. D. Armour: Operations. Dr. Pritchard: Bacterial Therapy Department. Mr. B. Harman and Mr. Gibb: Diseases of the Eye. 5 P.M., Lecture:—Dr. Owen: Glycosuria.

TUESDAY.—10 A.M., Dr. Robinson: Gynæcological Operations. Dr. Owen: Demonstration of Cases in Wards. 12 noon, Mr. T. Gray: Demonstration of Fractures, &c. 2 P.M., Medical and Surgical Clinics. X Rays. Mr. Baldwin: Operations. Dr. Davis: Diseases of the Throat, Nose, and Ear. Dr. Pernet: Diseases of the Skin. 5 P.M., Lecture:—Dr. Owen: Glycosuria.

WEDNESDAY.—10 A.M., Dr. Saunders: Diseases of Children. Dr. Davis: Operations of the Throat, Nose, and Ear. 2 P.M., Medical and Surgical Clinics. X Rays. Mr. Pardoe: Operations. Dr. Simson: Diseases of Women. Mr. Gibb: Diseases of the Eye. 5 P.M., Lecture:—Dr. Owen: Addison's Disease.

THURSDAY.—9 A.M., Dr. Bernstein: Bacterial Therapy Department. 2 P.M., Medical and Surgical Clinics. X Rays. Mr. D. Armour: Operations. Mr. B. Harman: Diseases of the Eye.

FRIDAY.—10 A.M., Dr. Simson: Gynæcological Operations. 2 P.M., Medical and Surgical Clinics. X Rays. Mr. Baldwin: Operations. Dr. Davis: Diseases of the Throat, Nose, and Ear. Dr. Pernet: Diseases of the Skin.

SATURDAY.—10 A.M., Dr. Saunders: Diseases of Children. Dr. Davis: Operations of the Throat, Nose, and Ear. Mr. B. Harman: Eye Operations. 2 P.M., Medical and Surgical Clinics. X Rays. Mr. Pardoe: Operations.

NORTH-EAST LONDON POST-GRADUATE COLLEGE, Prince of Wales's General Hospital, Tottenham, N.

MONDAY.—Clinics:—10.30 A.M., Surgical Out-patient (Mr. Y. Gillespie). 2.30 P.M., Medical Out-patient (Dr. T. R. Whipham); Gynæcological (Dr. Banister). 3 P.M., Medical In-patients (Dr. R. M. Leslie).

TUESDAY.—2.30 P.M., Operations. Clinics:—Medical Out-patient (Dr. A. G. Auld); Surgical (Mr. Howell Evans); Nose, Throat and Ear (Mr. H. D. Gillies). X Ray and Electrical Methods (Dr. Metcalfe). 3.30 P.M., Medical In-patient (Dr. A. J. Whiting).

WEDNESDAY.—Clinics:—2 P.M., Throat Operations (Mr. Gillies). 2.30 P.M., Children's Out-patient (Dr. T. R. Whipham); Sk[illegible] (Dr. G. N. Meachen); Eye (Mr. D[illegible]elli).

THURSDAY.—2.30 P.M., Gynæcological Operations (Dr. A. E. Giles). Clinics:—Medical Out-patient (Dr. A. J. Whiting); Surgical (Mr. Carson); X Rays and Electrical Methods (Dr. Metcalfe).

FRIDAY.—2.30 P.M., Operations. Clinics:—Medical Out-patient (Dr. A. G. Auld); Surgical (Mr. R. Gillespie); Eye (Dr. R. P. Brooks). 3 P.M., Medical In-patient (Dr. G. P. Chappell).

ROYAL HOSPITAL FOR DISEASES OF THE CHEST, Na[illegible] School, City-road, E.C.

MONDAY.—1.30 P.M., Department for the Prevention of Consumption. [illegible] Out-patient [illegible] tion. 2 P.M., Cardiac Department, Dr. [illegible] 3 P.M., Wards, [illegible] Department, Dr. Phear, Dr. S. Thompson. [illegible] Phear.

TUESDAY.—9 A.M., Laryngological Department, Mr. Mark [illegible] P.M., [illegible] Department for the Prevention of Consumption [illegible] 2 P.M., Out-patient Department, Dr. M. Leslie, Dr. B. [illegible] Operations, Mr. A. Evans. 3 P.M., Wards, Dr. White. 4 P.M., Wards, Dr. M. Leslie.

WEDNESDAY.—2 P.M., Wards, Dr. A. Davies; Out-patient Department, Dr. Drysdale, Dr. Kellie. 4 P.M., Wards, Dr. Drysdale. 4.30 P.M., Roentgen Ray Department, Dr. Jordan.

THURSDAY.—9.30 A.M., Dental Department, Mr. G. Thomson. 10 A.M., Cardiac Department, Dr. Stott. 1.30 P.M., Department for the Prevention of Consumption. 2 P.M., Out-patient Department, Dr. Phear, Dr. S. Thompson. 4.30 P.M. Laryngological Department, Mr. Mant.

FRIDAY.—1.30 P.M., Department for the Prevention of Consumption. 2 P.M., Wards, Dr. Calvert; Out-patient Department, Dr. M. Leslie, Dr. B. King.

SATURDAY.—10 A.M., Out-patient Department, Dr. Drysdale, Dr. Kellie. 11.30 A.M., Roentgen Ray Department, Dr. Jordan.

CITY OF LONDON HOSPITAL FOR DISEASES OF THE CHEST, Victoria Park, E.

Course of Demonstrations for Post-Graduates:—

THURSDAY.—4 P.M., Dr. D. Firth: Fibroid Lung.

THE THROAT HOSPITAL, Golden-square, W.

MONDAY.—5.15 P.M., Special Demonstration of Selected Cases.

THURSDAY.—5.15 P.M., Clinical Lecture.

For further particulars of the above Lectures, &c., see Advertisement Pages.

A DIARY OF CONGRESSES.

THE following Congresses, Conferences, and Exhibitions are announced. In 1914:—

May 1st–Nov. 1st (Lyons).—International Town Hygiene Exhibition.

,, 15th–Oct. 15th (Berne).—Swiss National Exhibition.

May–October (London, Shepherd's Bush).—Anglo-American Exposition.

June–July (Groningen).—University of Groningen 300th Anniversary Celebration.

July 15th–20th (Edinburgh).—Congress of the Royal Institute of Public Health.

,, 21st–23rd (Chester).—British Pharmaceutical Conference.

,, 27th–31st (London).—Fifth Annual Session of the Clinical Congress of Surgeons of North America.

,, 28th–31st (Aberdeen).—Eighty-second Annual Meeting of the British Medical Association.

July–September (Australia).—Eighty-fourth Annual Meeting of the British Association for the Advancement of Science. (July 28th to August 3rd at Perth, August 8th to 12th at Adelaide, August 13th to 19th at Melbourne, August 20th to 25th at Sydney, August 27th to Sept. 1st at Brisbane).

Aug. 2nd–10th (Paris).—Tenth Congress of Esperantists.

,, 3rd–8th (London).—Sixth International Dental Congress.

,, 10th–15th (St. Petersburg).—Twelfth International Congress of Ophthalmology.

,, 29th–Sept. 14th (Toronto).—Canadian National Exhibition.

Sept. 7th–12th (Berne).—International Congress for Neurology, Psychiatry, and Psychology.

,, 10th–12th (Fort William and Port Arthur, Ontario).—Fourth Annual Congress of the Canadian Public Health Association.

,, 21st–28th (Victoria, B.C.).—Dominion Exhibition.

,, 21st–28th (Vienna).—Third International Congress on Diseases of Occupation.

,, 30th–Oct. 4th (Brussels). Fourteenth French (de langue française) Congress of Medicine.

Oct. 31st–Nov. 2nd (Berlin).—First Congress of the International Society for Sexual Research.

EDITORIAL NOTICES.

IT is most important that communications relating to the Editorial business of THE LANCET should be addressed *exclusively* "TO THE EDITOR," and not in any case to any gentleman who may be supposed to be connected with the Editorial staff. It is urgently necessary that attention should be given to this notice.

It is especially requested that early intelligence of local events having a medical interest, or which it is desirable to bring under the notice of the profession, may be sent direct to this office.

Lectures, original articles, and reports should be written on one side of the paper only, AND WHEN ACCOMPANIED BY BLOCKS IT IS REQUESTED THAT THE NAME OF THE AUTHOR, AND IF POSSIBLE OF THE ARTICLE, SHOULD BE WRITTEN ON THE BLOCKS TO FACILITATE IDENTIFICATION.

Letters, whether intended for insertion or for private information, must be authenticated by the names and addresses of their writers—not necessarily for publication.

We cannot prescribe or recommend practitioners.

Local papers containing reports or news paragraphs should be marked and addressed "To the Sub-Editor."

Letters relating to the publication, sale, and advertising departments of THE LANCET *should be addressed "To the Manager."*

We cannot undertake to return MSS. not used.

MANAGER'S NOTICES.

THE INDEX TO THE LANCET.

THE Index and Title-page to Vol. I. of 1914, which was completed with the issue of June 27th, were given in THE LANCET of July 4th.

VOLUMES AND CASES.

VOLUMES for the first half of the year 1914 are now ready. Bound in cloth, gilt lettered, price 16*s.* carriage extra.

Cases for binding the half-year's numbers are also ready. Cloth, gilt lettered, price 2*s.*, by post 2*s.* 3*d.*

To be obtained on application to the Manager, accompanied by remittance.

TO SUBSCRIBERS.

WILL Subscribers please note that only those subscriptions which are sent direct to the Proprietors of THE LANCET at their Offices, 423, Strand, London, W.C., are dealt with by them? Subscriptions paid to London or to local newsagents (with none of whom have the Proprietors any connexion whatever) do not reach THE LANCET Offices, and consequently inquiries concerning missing copies, &c., should be sent to the Agent to whom the subscription is paid, and *not* to THE LANCET Offices.

Subscribers, by sending their subscriptions direct to THE LANCET Offices, will ensure regularity in the despatch of their Journals and an earlier delivery than the majority of Agents are able to effect.

THE COLONIAL AND FOREIGN EDITION (printed on thin paper) is published in time to catch the weekly Friday mails to all parts of the world.

The rates of subscriptions, post free from THE LANCET Offices, have been reduced, and are now as follows:—

FOR THE UNITED KINGDOM.		TO THE COLONIES AND ABROAD.	
One Year	£1 1 0	One Year	£1 5 0
Six Months	0 12 6	Six Months	0 14 0
Three Months	0 6 6	Three Months	0 7 0

(The rate for the United Kingdom will apply also to Medical Subordinates in India whose rates of pay, including allowances, is less than Rs.50 per month.)

Subscriptions (which may commence at any time) are payable in advance. Cheques and Post Office Orders (crossed "London County and Westminster Bank, Covent Garden Branch") should be made payable to the Manager, Mr. CHARLES GOOD, THE LANCET Offices, 423, Strand, London, W.C.

TO COLONIAL AND FOREIGN SUBSCRIBERS.

SUBSCRIBERS ABROAD ARE PARTICULARLY REQUESTED TO NOTE THE RATES OF SUBSCRIPTIONS GIVEN ABOVE.

The Manager will be pleased to forward copies direct from the Offices to places abroad at the above rates, whatever be the weight of any of the copies so supplied.

SOLE AGENTS FOR AMERICA—MESSRS. WILLIAM WOOD AND CO., 51, Fifth Avenue, New York, U.S.A.

The following magazines, journals, &c., have been received:— Journal of Anatomy and Physiology, Clinical Medicine, Philippine Journal of Science, Child, l'Hygiène de la Viande et du Lait, Quarterly Journal of Experimental Physiology, Archives of Pediatrics, Bristol Medico-Chirurgical Journal, Bulletin of the Johns Hopkins Hospital, American Journal of Medical Sciences, Man, Surgery, Gynecology and Obstetrics, Bio-Chemical Journal, South African Medical Review, St. Paul Medical Journal, Revue de Chirurgie, Revue de Médecine, Journal of Surgery, Indian Medical Record, British Journal of Surgery, Illuminating Engineer, Journal of Obstetrics and Gynæcology of the British Empire.

Communications, Letters, &c., have been received from—

A.—Messrs. Allen and Hanburys, Lond.; A, Lea Bridge-road; Messrs. Armour and Co., Lond.; Dr. J. H. Ashworth, Cliftonville; Dr. F. S. Arnold, Bovingdon; Dr. E. Ash, Lond.; Mr. R. Andrews, Sidmouth; Mr. P. H. Adams, Oxford.

B.—Mr. W. Butterly, Liverpool; Messrs. W. H. Bailey and Son, Lond.; Dr. F. E. Batten, Lond.; Bradford Corporation, Clerk to the; Boy Scouts Association, Lond., Secretary of; Messrs. J. Beal and Son, Brighton; *Birmingham Daily Post*, Manager of; Bristol City Asylum, Clerk to the; Mrs. Burgess, Governor's Camp, Bengal; Messrs. Butterworth and Co., Lond.; Colonel C. J. Bamber, I.M.S., Lahore; Miss V. E. Bates, New York; Mr. H. Butterfield, Northampton; Messrs. A. Burbridge and Co., Lond.; Blackburn and East Lancashire Royal Infirmary, Secretary of; Messrs. Boswell and Tomlins, Wolverhampton; Mr. W. T. Beswick, Buxton; Birmingham University, Secretary of; Mr. George Brown, Callington; Dr. Henry Blake, Great Yarmouth; Mr. H. J. Bendahan, Lond.; Mr. Geoffrey Besant, Lond.

C.—Canning Town Women's Settlement Hospital, Lond., Hon. Secretary of; Messrs. Cutting and Underwood, Lond.; Messrs. Crosby, Lockwood and Son, Lond.; Messrs. Cleaver and Co., Lond.; Mr. C. W. Chapman, Lond.; Cardiff Infirmary, Secretary of; Messrs. Casein, Lond.; Dr. H. M. Crake, Calcutta; Commissioners in Lunacy for Scotland, Edinburgh; Dr. Robert Chance, Lond.; Dr. A. E. Carver, Birmingham; Mr. John Clay, Cambridge; Mr. H. A. Collins, Croydon; Cameron Hospital, West Hartlepool, Secretary of; Dr. James W. Cook, Bury.

D.—Messrs. W. Dawson and Sons, Lond.; Dewsbury Guardians, Clerk to the; D. M. M.; Derbyshire Royal Infirmary, Secretary of; Devonshire Hospital, Buxton; Dr. Lovell Drage, Hatfield; Dr. Eugene Dupuy, Versailles; Dr. Ivor Davies, Cardiff; Lieutenant-Colonel A. M. Davies, Lond.; Professor S. Delépine, Manchester; Mr. R. Donald, Lond.

E.—Mr. A. R. Elliott, New York; Mr. A. Escudero, Toledo; Mr. A. E. Evans, Lond.; Dr. F. W. Edridge-Green, Lond.; Esculent Compounds Co., Lond.

F.—Dr. A. Mearns Fraser, Portsmouth; Mr. T. J. Faulder, Lond.; Mr. Bedford Fenwick, Lond.; Dr. R. Fortescue Fox, Lond.; Mr. G. Finch, Ipswich.

G.—Glasgow University, Secretary of; Grimsby and District Hospital, Secretary of; Mr. D. Grant, Lond.; Dr. J. O. Gavronsky, Lond.; Dr. E. W. Goodall, Lond.; Mr. H. J. Gauvain, Lond.; Dr. Dundas Grant, Lond.

H.—Mr. J. W. Hayes, Lond.; Dr. H. E. Haynes, Brentwood; Huddersfield Education Committee, Clerk to the; Dr. R. W. Hornabrook, Melbourne; Dr. H. M. Hicks, Amsterdam, N.Y.; Dr. E. C. Hort, Lond.; Dr. W. J. Howarth, Lond.; Dr. William Hunter, Lond.; Mr. C. A. Hill, Lond.; Hexham Rural District Council, Clerk to the; The Hospital, Newark, Secretary of; Dr. C. O. Hawthorne, Lond.

I.—I. T.; Lieutenant-Colonel T. W. Irvine, I.M.S., Peshawar; *Illuminating Engineer*, Editor of.

J.—Mr. W. Johnson, Lond.; Mr. Ellis O. Jones, Penygroes; Mr. F. S. C. James, Rochester, U.S.A.; Dr. O. Jennings, Peebles; Mr. Thomas Johnston, Hove.

K.—Messrs. H. S. King and Co., Lond.; Mr. Norman C. King, Lond.

L.—Mr. H. K. Lewis, Lond.; Leeds Public Dispensary, Secretary of; Mr. P. T. Leigh, Leeds; Messrs. E. and S. Livingstone, Edinburgh; Dr. C. E. Lea, Manchester; Dr. Mary F. Lucas, St. Margaret's Bay; Liverpool Stanley Hospital, Secretary of; London Press Exchange, Lond.; Leicester Guardians, Clerk to the.

M.—Mrs. Mugliston, Hatch End; Medical Agency, Lond.; Messrs. C. Mitchell and Co., Lond.; Dr. F. J. Malden, Malvern Link; Captain A. A. McNeight, I.M.S., Aden; Dr. F. MacCabe, Sandyford; Mr. A. L. Moreton, Lond.; Messrs. Maruya and Co., Tokyo; Matté Non-Alcoholic Beverage Syndicate, Lond., Secretary of; Dr. W. F. MacCarthy, Boscombe; Maltine Manufacturing Co., Lond.; Mr. R. A Lecture

ON

LOCALISATION OF MOTOR AND SPEECH CENTRES IN DEFINITE AREAS OF THE CORTEX OF THE BRAIN.

Delivered in the Physiological Laboratory of the University of London on June 8th, 1914,

By EUGENE DUPUY, M.D. Paris, &c.

Gentlemen,—The oldest localisation established is Flourens's "nœud vital," the seat of the principle of life in his language. He showed that a mere prick, and much more the removal of the nib of the calamus scriptorius, induces immediate death by sudden arrest of both respiration and circulation. But many years after Brown-Séquard showed by experiment that the nib of the calamus could be destroyed without inducing cessation of life, and I have collected a number of pathological observations, amongst others one published by Thiroloix and another by Professor Marinesco, which are most interesting, showing also that destruction of the "nœud vital" does not destroy life in man.

Later, in 1861, another localisation established was that of the faculty of articulate speech by Broca in the foot of the left third frontal convolution; he had had precursors, amongst others Bouillaud and Dax, father and son. This localisation was founded on pathological observations, and the three brains which Broca showed are at present —where they have been preserved from the beginning—in the Museum of Pathological Anatomy in Paris; they are to be seen every day. They show that they never have been *opened*—i.e., cut into sections—so that it is impossible to say what other lesions exist, if any, beside those seen on the surface of those brains.

It was in the early "seventies" that Fritszch and Hitzig showed by experiment that there exist in the convolutions of the brains of dogs certain spots which when irritated by means of galvanic currents give rise to definite movements of the limbs in a cross *manner—that* is, irritation on the right hemisphere provoked movements in the left limbs and *vice versâ*. Hitzig later brought forward some observations of lesions of those parts in man corroborating these experimental results; but it does not appear that much interest was raised on those facts until three years later, when came the first researches of my eminent colleague, Sir David Ferrier, who soon after, in his epoch-making work on the "Functions of the Brain," established both from experimental and pathological data the "doctrine"—for such it has been christened by Charcot—of the localisation of the functions of the brain. Hughlings Jackson, as is well known, had already shown in his studies—which must be recalled as models of clinical observations—the sequence of events from lesions of certain areas of the brain in the hemiplegia and epilepsy following.

Criticism of the Doctrine of Localisation.

Ever since one may say that the universal teaching has been that every convolution of the brain, and even every definite area of them, contain motor or *sensory* centres from which start the influence which animates, not only whole limbs on the opposite side of the body, but their different segments, and even the smaller organs, the thumb, for instance. The doctrine comprises the pyramidal tracts with their decussation, through which is effected the crossed action of the hemispheres on the spinal cord; since Mistichelli's time it has been universally adopted by all physicians and physiologists. With regard to loss of articulate speech, the doctrine is that destruction of Broca's convolution alone—it being the seat of the faculty of articulate speech in the left hemisphere for right-handed persons and in the right for left-handed—is the cause of aphasia; and later on Wernicke established that other form or so-called sensory aphasia, having its seat in the left temporal-parietal lobe of the brain also like Broca's aphasia.

I was struck at the very beginning of my medical studies and experimental work with certain facts which did not allow acceptance of the teaching prevalent. I had seen when attending in the post-mortem room—on some rare occasions it is true—Broca's convolution destroyed, and yet the patient had shown no signs of aphasia. I had seen rarely also hemiplegia happening on the same side as the lesion in the brain. Brown-Séquard, with whom I became acquainted at that time, had already been, much to my surprise and gratification, busy for some 15 years before collecting such cases and trying to explain their non-conformity with the accepted teaching by denying the theory of continuous conduction from certain areas of the hemispheres down through the crossed pathways of the pyramids to the spinal cord. He was teaching at that time that lesions of the brain, besides the one we saw, exerted an influence in distant parts which caused the paralysis observed—if I am not mistaken, the same theory which is now introduced by von Monakow under the name of diachisis.

I hold, however, that a doctrine is only true if it comprises in its scope all the facts, and that if one only well-observed fact is found to be contrary then the truth of the doctrine is reversed, to say the least. There are such facts which I believe absolutely vouched for; and, as I will show, the explanations given to make them enter into the classical "frame" are not by any means acceptable. Let me, for instance, state the case of hemiplegia on the same side as the lesion in the brain. There are many on record; one of the earliest, of which the publication seems to have been prompted by Brown-Séquard's teaching, is recorded by Dickinson, of Liverpool.

Hemiplegia with Brain Lesion on Same Side.

It is the case of a woman who was found on admission into the hospital to be in a state of coma; as there was a smell of alcohol in the expired air the stomach was pumped out. At the first return of consciousness there were vigorous efforts to put aside the instrument, and it was then noticed that in such efforts the *right hand*[1] only was used; on further pinching or pricking the surface of the body the whole of the *right side* responded pretty freely, but the *left* little if at all, only the slightest motion of the finger ends being perceptible. On the following morning, when the doctor saw the patient, she could move the *left arm* and *leg* slightly, though there seemed great reluctance and tardiness in doing so. There was evidently considerable loss of power, with somewhat diminished sensibility and reflex action on that side of the body. The functions of the *right side* seemed apparently perfect. There was complete ptosis of the *left eyelid* with external strabismus, distinctly marked paralysis of the *left* third nerve; the tongue was protruded straight. The patient was rational and able to articulate freely, and could even give some little account of herself when roused and pressed for a reply to questions. Later on the patient was able to walk across the ward, though she dragged the *left leg* a little and the *left arm* hung at her side. She made some more progress towards recovery to the point of being able to change her linen by herself and insisted upon going home. Then she suddenly became stupid and had to be lifted in bed, and soon became comatose. There still remained some slight reflex action and muscular response to pricking or pinching on the surface of the body except on the *left side*, the sensibility of which limbs seemed incomplete, or at any rate there was total loss of motor power in the limbs.

---

[1] No italics in Dr. Dickinson's text.

At the necropsy no fracture, contusion, or other evidence of external injury was found. On removal of the calvarium and opening the dura mater, which was healthy and entire, a considerable quantity of extravasated blood, amounting perhaps altogether to about three ounces, was found spread out in a layer on part of the lateral surface of the *left* hemisphere and lying in the cavity of the arachnoid. The excavation was entirely *confined to the left side*, and extended downwards along the Sylvian fissure to the base of the brain, where a small clot the size of an ordinary horse bean was seen pressing upon the trunk of the left third nerve. The blood effused was for the most part dark, clotted, and firm, and presented a somewhat shrunken and honey-combed appearance as if it had existed for a good many days. About the centre, however, of the *left* parietal lobe there was quite a fresh-looking and semi-fluid clot of about an ounce in bulk, but lying more superficially upon what appeared to be the older extravasation and gradually tailing off in quantity down the fissure of Sylvius. No rupture of the arachnoid could at first sight be discovered, nor any special focus from which the hæmorrhage might have sprung. Prolonged search showed that the origin of the hæmorrhage was evidently from the rupture of a small branch of the middle cerebral artery, situated in the *left parietal* fissure. The lateral parietal convolutions of the *left hemisphere* were slightly flattened and their surface deeply stained with blood, where the clot had pressed upon them. Nowhere, however, was there any irruption into the substance nor disturbance of the pia mater and arachnoid except at the bleeding point above indicated. The ventricles opened showed in the right one only a little fluid amounting to about 1½ drachms of clear serum. The whole of the *right hemisphere*, both in its superficial and internal structure, was most minutely and accurately examined and portions of it microscopically, but with the exception of the small quantity of serum in the ventricle no lesion or abnormality whatever was discernible, nor had the effused blood come in contact at the base, or at any point, with the surface of this side of the brain. The crura cerebri, pons Varolii, cerebellum, medulla oblongata, and upper portion of the spinal cord were also very carefully examined, but without revealing anything of an unusual character. It is to be specially noticed that the decussation of the anterior pyramids of the medulla was very well marked in the fresh state, and the parts having been hardened and afterwards examined microscopically exhibited no appreciable deviation in the crossing and arrangements of the fibres from the appearances universally recognised as normal.

CONCLUSIONS FROM ABOVE AND OTHER CASES.

I have given this case in such length with details because of its importance. It does not seem necessary to enlarge on the fact that we have here a case of which the features are absolutely contrary to the teaching universally adopted; and I have chosen that one case out of many others published since on account of the extreme care with which it has been studied by the author, it being the first in which microscopic examination was ever done. Similar observations regarding the importance of the pyramid decussation only have been made by Vulpian, who showed that the destruction of these strands of fibres *does not* prevent the conduction of motor impulses from the brain to the spinal cord.

Other cases have been observed in great number in which it has been often found that the tumour or hæmorrhage had caused œdema in the opposite hemisphere, much stress has therefore been laid on this fact to prove that motor symptoms observed were to be attributed to that œdematous hemisphere only. Not only does this œdematous condition not exist in all the cases observed, but if such were the rational interpretation it would follow that the hemisphere on the same side as the motor symptoms had no function at all, since it is found destroyed without motor symptoms occurring on the opposite side. In the case of Dr. Dickinson, however, it is specially noticed that no such œdematous condition existed, nor can the little serum found in the ventricle be considered sufficient to account for the motor phenomena; there are so many cases on record to the contrary. Therefore the elements of the localisation doctrine as regards the effects of motor impulses from the centres in the hemispheres along continuous strands of fibres crossing in the medulla pyramids are not in accordance with well-ascertained facts, and must be accordingly rejected.

RESULTS OF EXPERIMENTS AND PATHOLOGICAL OBSERVATIONS.

Let me now come to the convolutions of the cortex and report some results of experiments and observations of pathological facts.

First, it is not irrelevant to state that lesions of both hemispheres in almost the same ratio cause paralysis in the opposite side of the body. In the first 600 cases of hemiplegia which I have collected 260 show lesions in the right hemisphere, from which fact we may conclude that there is no difference in the functions of the two halves of the brain. Now it occurs, as is universally known, that in the Rolandic areas centres exist the irritation of which causes definite movements in the limbs on the opposite side, while destruction of that particular area brings about a paresis, or at all events awkwardness in that limb; but after some time this paresis or awkwardness disappears. It is said then that the corresponding or homologous area in the other hemisphere has taken up the lost function because it had been ascertained that such "suppléance" could not be found to exist in the surrounding parts of the destroyed "centre," a fact which went a long way to show the well-defined localisation in a given centre. But other experiments have been done which do not allow such a theory, for Carville and Duret, as I had also shown, found that, say, the right foreleg of the dog had recovered from the paresis or awkwardness following the destruction of its so-called centre, then if the corresponding or homologous centre in the right hemisphere is destroyed no paresis or awkwardness returns in the right foreleg, but in the left foreleg only. Therefore the explanation is not acceptable.

It is not possible to perform such experiments in man, but there are at present a great number of pathological cases which point the same way; for instance, the numerous operations performed by surgeons to remove the cause of convulsions or contractures—cases which show that the so-called motor centres for the arm, for instance, or the hand having been removed, not only the convulsion or contracture disappeared but no paralysis ensued. I have collected 47 well-studied cases of this sort, and the one which is recorded in Sir Victor Horsley's Linacre lecture is certainly most interesting. As the mind is so fashioned that it does not seem ever willing readily to abandon adopted theories, it is supposed only automatic movements are retained after those operations, since those movements are said to have their seat in other or lower centres than the cortex, but that willed or newly acquired movements would always be lost. This instance shows once more how dangerous it is to predict, because I have shown as far back as 1873 that in dogs when the "centres" for the movements of the foreleg and paw have been removed, not only do the leg and paw recover, but tricks can be performed, either tricks learnt before or after the operation. I am happy to find that my distinguished colleague Professor C. S. Sherrington has very lately been able to show that in the chimpanzee the same results are obtained.

It is but reasonable, therefore, to admit that the so-called motor centres are not necessary for the normal functional activity of the parts which they are said to govern, and yet it is not possible to deny that irritation, produced by experimental methods in animals and by disease in man, is followed by movements or paresis in the limbs. It is to an explanation of the mode of production of those that I shall devote the time you are patiently according me. I have collected several more or less well-studied cases in which a very large portion of one hemisphere had been destroyed by disease without paralysis having been noticed in the patient.

LOCALISATION IN REGARD TO LOSS OF SPEECH.

Allow me now to speak of localisation in regard to loss of speech. Up to six years ago I may say that all were in agreement that speech depends upon Broca's convolution in the left hemisphere only for right-handed persons, and in the right hemisphere for left-handed persons. The other form of aphasia, so-called sensory or Wernicke's (Bastian had before called attention to that species), also conforms to this rule, and its seat is placed in the temporo-parietal cortex. It is true that some writers have not altogether from the beginning taken for proved this theory of aphasia, and that even so early as two or three years after Broca's publications Bateman and Charcot, among others, published observations contrary to absolute acceptance of the rule; and let those who wish to learn more on the matter or refresh their learning read Trousseau's immortal lectures not only for a knowledge of the whole subject at the time, but also because Trousseau is the first who clearly saw and taught that aphasia is a disorder of the motor as well as of the intellectual activity of the brain. I have, as I said before, even during my student days found cases that did not confirm Broca's so-called law. In the course of succeeding years I found other cases also contrary, to which I called attention in the lectures that I delivered in different American colleges and societies. In 1891 I read a paper before the Neurological Society in London in which I particularly laid stress on the fact that pathological observations conclusively proved that Broca's convolution had nothing to do with aphasia.

It was only seven years ago, when Professor Pierre Marie, covering the same ground, wrote his paper that created such a sensation among neurologists, that the subject attracted universal attention, presumably because the hour had come. He did not only confine himself to denying or disproving Broca's localisation in the foot of the third left frontal convolution, but he also tried to show that what we call aphasia is composed of different conditions—one the loss of power of pronouncing words, and the other the loss of comprehension and understanding, or sensory aphasia so-called. He endeavoured to establish the seat of the real lesion of aphasia in that part of the temporo-parietal lobe which he defined in a quadrilateral space including Wernicke's convolution and deeper parts. I go with him in denying the function, so-called, of Broca's convolution, since, as I have already said, a great number of cases in which this had been destroyed with no aphasia had been recorded, but I also must disbelieve that the quadrilateral space he mapped out contains the centre of the speech faculty for the same reason: that this has been found destroyed when no aphasia existed. I have collected several such cases. And there are other arguments.

Karl Mendel has lately recorded the case of a woman aged 42 who was certainly right-handed and of whose relatives none were ever left-handed. She became paralysed on the whole of the left side as the result of an embolus from cardiac disease and had complete motor so-called aphasia. The lesion was found at the necropsy to be embolic softening of the right inferior frontal convolution, the right island of Reil, and the right superior temporal convolution. A microscopical examination was made of both hemispheres, and the lesions above described were the only ones found: the left hemisphere was intact, and the pyramidal tracts were normally crossed in the lower part of the medulla. The author concludes that this is a case in which the motor (Broca's) speech centre is placed in the right hemisphere in a right-handed person; but as there had been neither sensory (Wernicke) aphasia nor non-agraphia, the sensory speech centre must be localised in the left hemisphere, seeing that the right superior temporal gyrus was destroyed. If ever there was an example of begging the question I believe this is one. Since the superior temporal convolution in the right side was destroyed and no symptom observed, then that portion of the brain had no function, and why should one be asked to accept this saying after it has been so well recorded that motor aphasia, Broca's, was produced *by destruction of the third frontal in this same hemisphere?*

I have seen with Luys, who *published* the record of the case, a very remarkable instance of the immense difficulty, not to say impossibility, of establishing the fact that loss of speech is due to destruction of those so-called centres. In this case there was softening destroying the posterior portion of the third frontal convolution, all the insula convolutions had disappeared, the ascending frontal and parietal at their junction were destroyed; the first temporal was broken down, all the cortex of the insula group and marginal convolutions around were destroyed; the grey substance of the corpus striatum extraventricular nucleus was destroyed, and only vestiges of the intraventricular nucleus probably existed. There was complete motor aphasia, and please mark, 18 months after the stroke the patient all at once, without preparation, began suddenly to speak.

MECHANISM OF SYMPTOMS IN BRAIN LESIONS.

I have made this observation in this place as its lesson will lead me naturally to offer the explanation which I believe is the rational one of the mechanism of symptoms in brain lesions. I do not wish to be understood to say that the cortex has no function, but I wish to state clearly that the area of the seat of definite function, as the doctrine universally adopted will have it, is erroneous. In the light of the examples which I have reported it appears that there are no supplemental centres, but that all the cortex is endowed with the faculty of acting in specific and differentiated manner, and that at most disease or destruction of a given area brings on, say, motor paralysis or aphasia by an inhibitory influence, acting both on other parts of the cortex as well as on the ultimate processes, to the nucleus of the nerves which through the muscles manifest the functions externally. This inhibition would naturally imply alterations of the muscular sense. Brown-Séquard for the last 20 years of his life endeavoured to introduce that theory in science, and I do not know that many followed him. I cannot see any other hypothesis that will account more satisfactorily for all the different manifestations of lesions of the brain; and now let me give a last instance.

A man was found to have in a very short time become amaurotic in one eye. This condition lasted 13 months, and no morbid symptom existed anywhere except a discharging abscess from one tooth in the upper jaw, which, having become a real infirmity, was drawn out. It was found that in its root canal lay a sharp thin spindle of wood from a toothpick which the patient had used in order to cure the tooth which was decayed and which was evidently the cause of the recurrent abscesses. But in a very short time, three days in all after the withdrawal of the tooth, sight had returned completely in the amaurotic eye. Here it is no exaggeration to state that the lesion of the nerve of the tooth induced by inhibition the amaurosis.

Inhibition is not a process of a mysterious nature. It does not consist either, as Claude Bernard taught, in a phenomenon of interference familiar to physicists, nor do I believe it to consist in the action of a synapse, for that implies an organ with a special function, whereas inhibition is a property of the whole nervous system, and one cannot imagine an organ generated by an irritation. But it is most presumably, as Brown-Séquard taught, "une transformation de forces." As I have never seen a lesion made in the brain cortex in any special area not followed by distant and appreciable alteration of tissue elsewhere, it appears to me that by such a process the activity of parts may be altered or inhibited, and one proof thereof consists in the fact that there always elapses a certain length of time before the manifestation of inhibition after irritation and before the restoration of the activity in the part inhibited after the removal of irritation. I do assure you that I have no pretention to have settled for ever the question of the functions of the cortex, but I beg you who have so patiently listened to me to consider, if even with the critical eye, the facts and arguments I have laid before you.

A REDUCTION IN THE VIRULENCE OF TUBERCLE BACILLI STORED IN NORMAL SALINE.

BY LEONARD S. DUDGEON, F.R.C.P. LOND.

(From the Department of Pathology, St. Thomas's Hospital.)

IN this preliminary communication certain experiments will be cited which show the effect of storage on the pathogenicity of the tubercle bacillus. It is important at the outset to emphasise that the different results produced refer to the effect of the inoculation of definitely known quantities of the tubercle bacillus. Four strains were employed of the untreated bacillus, while the organism which was used in the experiments included in Group 4 had been previously treated with immune tuberculous serum in the manner about to be indicated. In each instance the cultures of the tubercle bacillus isolated from a human source were obtained from the sputum of cases at the Brompton Hospital Sanatorium at Frimley, for which I am indebted to the kindness of Dr. W. O. Meek, the superintendent. Further observations on this subject will be published at a later date in conjunction with Dr. Meek.

The sputa were passed through guinea-pigs, and the viscera of the infected animals were sown on Dorset's egg medium. When an abundant growth was obtained, which was usually in about three to four weeks, it was carefully scraped off the surface of the medium, partially dried to remove surplus water which had condensed on the bacilli from the medium, and carefully weighed on sterile platinum foil. The masses of bacilli were then shaken with a definite quantity of sterile saline[1] and some glass beads until a uniform emulsion was obtained, which was finally stored in dark brown bottles and kept in a dark cupboard at room temperature so that each sample was kept under identical conditions. Definite quantities were removed at various times, inoculated into animals and the results carefully noted.

The method employed in the preparation of the treated tubercle bacilli has been referred to elsewhere,[2] but it may be mentioned here for convenience that after the bacilli had been scraped off the surface of Dorset's egg medium they were partially dried, weighed, and then shaken in sterile saline to break up the clumps. The saline was pipetted off, and the solid residue was thoroughly mixed in 2 c.c. of sterile saline so that a very turbid suspension of bacilli was obtained to which 2 c.c. of immune rabbit serum were added and the total mixture was incubated at 37° C. for 20 hours and kept at room temperature for 4 hours. The bacilli were then thoroughly washed in sterile saline and finally suspended in that medium and stored in brown bottles as already indicated.

[2] [illegible] by L. S. [illegible] vol. xix., No. 1, [illegible]

SERIES I.

Culture of the human bacillus obtained from the tissues of a guinea-pig which developed generalised disease within a period of three weeks from the inoculation of human sputum. When this bacillus was injected intravenously into two rabbits in doses of 3 mgm. and 1·5 mgm. respectively, it was found to have the usual pathogenic properties common to the human bacillus for the rabbit. At the same period two guinea-pigs were infected with similar quantities of the bacillus and developed generalised tuberculosis of an advanced type within a period of four weeks.

Effect of 3½ months' storage.—Two guinea-pigs were inoculated subcutaneously as follows: one animal received 3 mgm. and the other 1·5 mgm. The guinea-pig which received the smaller dose was killed three weeks later, but no lesion of any kind was found at the post-mortem examination, and no tubercle bacilli could be demonstrated in film preparations of the spleen. The second animal, which had received 3 mgm., was killed at the end of five weeks and was found to have developed a local fibro-caseous lesion, caseous inguinal and lumbar glands, and very few tubercles in the spleen, but no tuberculosis elsewhere. Beaded tubercle bacilli were present in every lesion.

Effect of 5 months' storage.—One guinea-pig was injected subcutaneously with 3 mgm. and the other with 1·5 mgm. of the same emulsion of tubercle bacilli. Three weeks later the animal which had received the smaller dose was killed, but there was no lesion of any kind at the post-mortem examination. The spleen of this guinea-pig was emulsified in saline and injected into two others, but without result. The second guinea-pig, which had received 3 mgm., was killed at the end of six weeks, but no lesion of any kind was found. The spleen of this animal was also emulsified in saline and injected into two guinea-pigs, but without result.

Summary.—In the preceding experiments we have investigated the effect of storage on a bacillus isolated from the sputum of a patient who was suffering from pulmonary tuberculosis. It reacted like the human bacillus as regards its pathogenicity for the rabbit, while at the same time it was highly pathogenic for the guinea-pig, but after 3½ months' storage the virulence of this organism for the guinea-pig was considerably reduced, while in 5 months it failed to produce any effect when inoculated *in the doses cited* into such a highly susceptible animal as the guinea-pig. Still further, the spleen of these inoculated animals was proved to be sterile. This point is of importance, as it has already been shown[3] in the case of birds which had been fed daily for periods varying from 6 to 36 weeks with human sputum that, although they did not develop any positive evidence of tuberculosis, yet, in 1 instance out of 8, the spleen of a pigeon which had been fed with sputum for 19 weeks and showed no macroscopical evidence of disease when emulsified in sterile saline and inoculated into a guinea-pig produced typical tuberculosis.

SERIES II.

In this case the tubercle bacillus was obtained from a patient suffering from pulmonary tuberculosis. The only special feature of the organism was its beaded appearance in film preparations. This bacillus was cultivated from the spleen of an infected guinea-pig on Dorset's egg medium, and when 2 mgm. were inoculated intravenously into two rabbits it set up an extreme degree of generalised tuberculosis which terminated fatally within a period of five weeks. At the same period two guinea-pigs were inoculated subcutaneously with 6 mgm. of this bacillus. One animal was killed three weeks later. There was a local abscess, large caseating inguinal and abdominal glands, and tubercles were present in the spleen and liver. The other animal, which was much wasted, was killed six weeks later and showed advanced general tuberculosis. Two guinea-pigs were injected also with 3 mgm. of the bacillus. One animal was killed three weeks later. There was a local abscess and a large caseating inguinal gland. The other animal which was killed within six weeks showed advanced general tuberculosis, with an extreme degree of infection of the liver.

Effect of 1 month's storage.—Two guinea-pigs were inoculated subcutaneously with 6 mgm. of this bacillus. One animal which was killed at the end of three weeks had developed a local fibro-caseous lesion and caseous inguinal glands, but no other lesion was discovered. The second guinea-pig was killed at the end of six weeks. This animal had a local abscess, and the inguinal and iliac glands were found to be caseous, but no tubercles were present in the spleen and liver and the animal was not much wasted.

Effect of 10 weeks' storage.—Two guinea-pigs were inoculated subcutaneously with this bacillus. One animal received 6 mgm. and the other 3 mgm. The animal which received the larger dose was killed at the end of three weeks, but there was no abscess—only a hard mass in the muscles at the seat of inoculation—no glandular enlargement, and no infection of spleen or liver. Tubercle bacilli were present in the local lesion, but *none* were found in the *spleen*. The spleen of this guinea-pig was used for inoculation purposes, as will be mentioned later. The second animal, which was killed at the end of six weeks, had developed a local abscess and tuberculosis of a limited type in the spleen and glands, and a few tubercles were present in the liver. Two guinea-pigs were inoculated with the entire splenic extract of the first animal of the preceding experiment. One pig was killed 17 days later and was found to be normal. The second animal, which was killed in 5½ weeks, showed a local abscess, caseous lumbar and iliac glands, and tubercles in the spleen, but no tubercles in the liver. Films were made from the ground-up liver tissue, but no tubercle bacilli were seen.

Effect of 3 months' and 3 weeks' storage.—One guinea-pig was inoculated subcutaneously with 3 mgm. of the bacillary emulsion and was killed at the end of five weeks. There was no local lesion, but the deep inguinal glands were enlarged and slightly caseous, and tubercle bacilli were demonstrated in the caseous tissue. The iliac glands were enlarged, but not caseous. The spleen was normal, and no other changes of any kind were detected.

Summary.—In these experiments we have been studying a bacillus isolated from human sputum which was highly pathogenic for rabbits in doses of 2 mgm. and was also equally virulent for guinea-pigs. The effect of storage was studied up to a period of 15 weeks, by which time the material was exhausted. If we compare two of the experiments which were made at the beginning of the series and at the end respectively in which guinea-pigs were inoculated with a similar dose of 3 mgm. we find advanced tuberculosis on the one hand as compared with a very limited lesion confined to tuberculosis of the inguinal and iliac glands. Such results compare favourably with the loss of pathogenicity at the end of five months' storage, which has been referred to in detail in the first series of experiments. Another point which may be discussed is the altered type of local change which is produced by the "stored" bacilli. If guinea-pigs are inoculated with bacilli which have been stored for a certain period and are examined within the first three weeks they may show only an inflammatory nodule[4] without caseation, or even no lesion whatever at the site of injection, while the animals killed in the fifth or sixth week after inoculation with the stored bacilli may show a local abscess. It would appear that the local resistance is such that for a certain time a more or less conservative process is established against the bacilli of reduced virulence, but later this is insufficient to withstand the action of the bacillus, and caseation results.

SERIES III.

In this series the culture of the tubercle bacillus was obtained from a case of pulmonary tuberculosis, and the characteristic feature of this organism was its beaded appearance. It set up rapid tuberculosis in guinea-pigs, and was recovered in pure culture on Dorset's egg medium from the spleen of the infected animals. When 2 mgm. were inoculated intravenously into two rabbits it gave rise to generalised tuberculosis and death of the animals within one month from the time of inoculation. At the same period 6 mgm. of this bacillus were injected into two guinea-pigs. One animal was killed two weeks later; it showed a local abscess, caseating inguinal and iliac glands, and tubercles in the spleen, but none elsewhere. The second animal, which was killed six weeks later, had developed advanced general tuberculosis. Two guinea-pigs were inoculated, also subcutaneously, with 3 mgm. of the same bacillus. One animal, which was killed in three weeks, showed a local abscess, caseous inguinal and abdominal glands, and tubercles in the spleen and liver. The second animal, killed in six weeks, had developed general tuberculosis.

[3] A Contribution to the Study of the Relationship between Avian and Human Tuberculosis, by S. G. Shattock, C. G. Seligmann, L. S. Dudgeon, and P. N. Panton, Proceedings of the Royal Society of Medicine, December, 1907.

[4] In such areas a very high degree of phagocytosis occurs, similar to the lesions found in avian tuberculosis.

Effect of 4 weeks' storage.—Two guinea-pigs were inoculated subcutaneously with the stored bacillus. One animal received 6 mgm. and the other 3 mgm. The pig which had received the larger dose was killed at the end of three weeks; a local abscess, caseous iliac glands, and small tubercles in the spleen had developed. The second animal, which had received 3 mgm., was killed in 5½ weeks, and showed genera tuberculosis of a moderate type.

Effect of 2½ months' storage.—Two guinea-pigs were inoculated subcutaneously with this bacillus. The animal which received 6 mgm. was killed at the end of three weeks and showed a local area of necrosis and a local caseating gland, but the spleen was normal and there were no lesions elsewhere. The apparently normal spleen from this pig was used for inoculation into other guinea-pigs (see below). The other animal, which had received 3 mgm., was killed at the end of six weeks; a local abscess, caseous inguinal glands, tuberculosis of the spleen of a limited type, and a few small tubercles in the liver were found to be present. Two guinea-pigs were inoculated with the emulsified spleen of the first animal of this experiment. One guinea-pig, which was killed in 17 days, had developed a large local abscess showing abundant tubercle bacilli, and also caseous inguinal and lumbar glands. The spleen was normal and no tubercle bacilli were seen in film preparations of the splenic tissue. The second animal, which was killed at the end of five weeks, showed a local abscess, caseous inguinal and lumbar glands, and the spleen was enlarged and caseous.

Effect of 3½ months' storage.—Two guinea-pigs were inoculated subcutaneously with 6 mgm. of the stored bacillus. One animal was killed in 19 days. There was no local lesion, the inguinal and iliac glands showed some slight enlargement, but no caseation was detected. Film preparations made from these glands revealed the presence of tubercle bacilli. The second guinea-pig, which was killed at the end of five weeks, had developed a local abscess showing numerous tubercle bacilli, caseous inguinal and iliac glands, tuberculosis of the spleen, but no tuberculosis elsewhere.

Summary.—In these experiments bacilli stored for 3½ months were still found to be actively pathogenic, although a very distinct reduction in the extent of the lesions incited in the infected guinea-pigs was observed. This fact can be appreciated by referring to the details of the experiments as shown by the inoculation of 6 mgm. of the fresh bacillus and the bacillus which had been stored for 3½ months, when the effect of the altered virulence is at once obvious, more especially in the case of the guinea-pigs which were killed within a period of 14 to 19 days.

SERIES IV.

Treated Bacilli.

Two guinea-pigs were injected subcutaneously with the treated bacilli. One guinea-pig, which received 9 mgm., was killed two weeks later. There was a large local caseous abscess showing abundance of tubercle bacilli, caseous inguinal and iliac glands,. and a very large caseous spleen. The other animal, which received 1·85 mgm., was killed at the end of one month. There was a large local abscess containing numerous tubercle bacilli and advanced general tuberculosis.

Effect of 3 months' storage.—Two guinea-pigs were inoculated with 9 mgm. of the same treated bacillus. The first animal, which had been injected intraperitoneally, was killed two weeks later, but no macroscopic changes were detected. The omentum appeared to be quite normal, but when examined microscopically patches of fibrous tissue, including numerous endothelial cells and small giant cells, were found. There was no caseation, but tubercle bacilli were present in large numbers and almost entirely intracellular. The other guinea-pig died at the end of one month. There were a local lesion with numerous tubercle bacilli, early tuberculosis of the spleen, and caseous inguinal glands. Two guinea-pigs were inoculated with 3·7 mgm. of the same treated bacillus.. The first animal, which had been injected intraperitoneally, was killed two weeks later, but no change was detected. The omentum taken for microscopy, however, showed fibrosed cellular patches containing both small and large giant cells, but no caseation. Bacilli were numerous, but almost entirely within the giant cells. The second guinea-pig, which had been inoculated subcutaneously, was killed at the end of one month. There were a local abscess showing tubercle bacilli, caseous inguinal and lumbar glands, and limited tuberculosis of the spleen. One guinea-pig was inoculated with 9 mgm. of the same treated bacillus subcutaneously, and was killed two weeks later. The post-mortem examination revealed encapsulated nodules in the muscles of the leg, but no glandular enlargement, and no other lesion was detected. A film of the muscle lesion showed massesof tubercle bacilli inside giant cells and endothelial cells.

Effect of 4½ months' storage.—One guinea-pig received 1·5 mgm. subcutaneously, but no lesion of any kind was detected 14 days later, while another pig, which had been injected subcutaneously with 3 mgm., when killed at the end of one month was found to have a local abscess, caseous inguinal and lumbar glands, and some small tubercles in the spleen, but none elsewhere.

Effect of 5½ months' storage.—One guinea-pig was inoculated with 1·5 mgm. of the stored bacillus, and was killed seven weeks later. It was not wasted. There were a local fibro-caseous abscess, caseous inguinal and lumbar glands, and some large tubercles in the spleen and a few small tubercles in the liver. The spleen and local lesions obtained from this guinea-pig were inoculated separately into four guinea-pigs; in each case rapid and generalised tuberculosis was produced.

Summary.—It may be stated at the outset that treating the bacillus with immune tuberculous serum had no effect on its pathogenicity, while storage cannot be said to have reduced the virulence to the same extent as occurred with the other cultures of the tubercle bacillus employed. The difference, however, between general tuberculosis such as occurs with recently cultivated bacilli and that which is induced by means of stored bacilli has only to be seen to be appreciated. Further, it has been shown that bacilli present in a local lesion and in the spleen of a guinea-pig which had been inoculated with bacilli stored for five and a half months were capable of inducing fully active tuberculosis if planted in fresh animal soil.

Attention also must be drawn to the limited tuberculosis of the peritoneum in guinea-pigs inoculated with such samples of stored bacilli. In fact, the contents of the peritoneal cavity appeared to be normal, but microscopical examination of the omentum revealed a condition almost akin to leprosy. These observations agree with those of Stanley Griffith[1] recently published on the strains of tubercle bacilli isolated from cases of human lupus. In this valuable contribution to the study of tuberculosis the author's own words may be quoted: "Cultures were obtained from no fewer than ten guinea-pigs without macroscopic lesions of tuberculosis. ...... The absence of macroscopic tuberculosis in a guinea-pig inoculated with lupus material and examined within five weeks does not therefore necessarily signify that there were no tubercle bacilli in the material inoculated." The observations made by Griffith on the effect of inoculating guinea-pigs with certain samples of lupus material agree with the experiments recorded here on the effect of intraperitoneal inoculation of guinea-pigs with a certain strain of stored tubercle bacilli.

SERIES V.

Bovine Tubercle Bacillus.

This bacillus, which was supplied to me through the kindness of Professor S. Delépine, was cultivated for three weeks on egg medium, and when inoculated into rabbits and guinea-pigs gave rise to rapidly fatal tuberculosis in doses of 1 mgm. and 0·5 mgm.

Effect of 7 months' storage.—Two guinea-pigs were inoculated with 1 mgm. and 0·5 mgm. respectively of the bacillus which had been stored in saline. Neither showed any evidence of tuberculosis at the end of six weeks, and no tubercle bacilli were detected in antiformanised residues of the respective spleens.

---

[1] Further Investigations on the Strains of Tubercle Bacilli Isolated from Cases of Lupus, by A. Stanley Griffith, Journal of Pathology and Bacteriology, vol. xviii., No. 4, April, 1914.

Effect of 8 months' storage.—Two guinea-pigs received subcutaneously 57 mgm. of the stored bovine bacillus, but without result at the end of six weeks, and the spleens of these guinea-pigs when inoculated into further guinea-pigs failed to excite tuberculosis.

Summary.—In this experiment we have the full effect of storage on the bovine tubercle bacillus. An actively virulent bovine bacillus was rendered non-virulent as far as the guinea-pig tests serve to show by this means, and further, such an enormous dose as 57 mgm. failed to incite any macroscopical lesion, and, moreover, the spleens of these animals were shown to be sterile.

Film preparations of the various samples of the tubercle bacillus were made before inoculation of the animals, so that any question as to whether the inoculated material contained bacilli need not be considered.

These results are of sufficient interest to record even at this stage of the investigations, but a large amount of work will have to be done to show the periods at which such alterations of pathogenicity occur. It is well known that when bacteria are kept in an unsuitable medium they may lose their virulence, but the interest in these experiments rests in the gradual reduction of the pathogenicity of the bacillus stored in normal saline and also because these observations are based on the effect of the inoculation of known quantities of the bacillus at various intervals.

It must be mentioned, however, that all my experiments refer entirely to the alteration of the pathogenicity of the tubercle bacillus for such a susceptible animal as the guinea-pig, and no attempt has been made to study the rate of growth of the stored bacillus on artificial media, but cultivations were made from the infected tissues of the guinea-pigs on numerous occasions and compared with the originals. No attempts were made, however, to subcultivate the stored bacillus direct from the saline-bacillary mixture, as such observations are associated with certain fallacies which do not exist in experiments on pathogenicity, and after all this is the most important characteristic of a microorganism.

OBSERVATIONS ON 120 CASES OF LEAD ABSORPTION FROM DRINKING-WATER.

BY W. W. STAINTHORPE, M.D., B.S. DURH.

THE occurrence of plumbism, due to a contaminated water-supply affecting a considerable number of the consumers, is so rare in the present day that I feel that a detailed report of some of those cases that came under my observation during a recent epidemic at Guisborough will be of interest to the medical profession.

The outbreak was the subject of a Local Government Board inquiry last autumn and was clearly traceable to the water-supply, which at intervals had been found to contain lead in solution, due to the fact that the water supplied to the houses in the town passed through lead service pipes, and that the water itself had at times a distinctly plumbo-solvent action, especially after heavy rains. Plumbism from this cause differs largely from that arising in lead factories because of the small amount of the poison taken into the system in a given time, and as the poison is a cumulative one some time may elapse before the onset of any symptoms, however slight, which may afford assistance towards the elucidation of the actual causation; also severe intoxication may have taken place prior to any symptoms pointing to plumbism having made themselves manifest, by which time grave structural changes may have occurred in the kidney, liver, or nervous tissues, leading to premature old age or to a fatal termination from Bright's disease, cirrhosis, paralysis, &c. I attended a large number of patients suffering from the intoxication and I had the misfortune to contract the disease myself. The following observations are, however, confined to 120 serious and typical cases, about each of which I made careful notes. The age and sex of these patients and the number affected at the different age-periods are set forth in the following table, together with the number of fatal cases:—

Ages.	Male.	Female.	Total.	Died.
Birth—6 weeks	1	2	3	0
1 year—20 years...	3	4	7	1
20 years—30 "	8	15	23	0
30 " —40 "	19	26	45	1
40 " —50 "	10	10	20	1
50 " —60 "	6	8	14	0
60 " —70 "	3	5	8	1
Totals	50	70	120	4

In this series of cases all stages of the intoxication were seen, from the commencing general languor and debility, attended by anæmia, to the paralytic stage, ending in convulsions and death. Amongst the number are three infants under the age of six weeks who from birth had been nourished solely upon the breast. Lead was found in the mother's milk in each instance, and in the urine in two instances. Children are supposed to be ready victims to the disease, and I am at a loss, therefore, to account for the small number affected. That some persons are more susceptible to the poison than others is clearly shown in the case of two individuals who developed symptoms after only six weeks' residence in the locality.

As will be seen by the above table, 4 deaths occurred directly traceable to lead intoxication, 1 from convulsions and 3 from chronic Bright's disease accompanied by cirrhosis of the liver. A chemical examination of the liver, kidneys, and spleen from one of these cases showed the presence of lead, the largest amount being found in the spleen. The signs and symptoms of the disease were very varied, and may best be described separately under the following headings. The figures show the number affected by particular symptoms:—

Premonitory symptoms	120	Menstrual disorders ...	55
Abdominal	102	Abortions	5
Headache	91	Blue line on gums ...	15
Anæmia	95	Constipation	40
Nervous and muscular disorders		Convulsions	2
	89	Albuminuria	20

Premonitory Symptoms.

Careful inquiry into the previous history of these cases of plumbism revealed that they had all passed through a period of ill-defined indisposition, in some cases of a few weeks' duration, in others for a longer time, during which their subjective feelings were so indefinite and irregular as hardly to merit much notice being taken of them by the patients themselves. The following symptoms were usually observed: General lassitude; weariness; languor; tiredness, at first after slight exertion, afterwards even after sleep; restlessness of mind and body; incapacity for work; occasional fits of mental depression; irritability of temper; alteration of disposition; desire to sleep at any moment, sleep being heavy, fitful, and unrefreshing; and sudden craving for food, especially soon after meals (in a few cases), although usually loss of appetite, nausea, and anorexia, accompanied by a peculiar, sour, rancid, clammy taste in the mouth in the early morning, prevailed.

Abdominal Symptoms.

These symptoms were grouped under the following five varieties: (1) Abdominal distension; (2) abdominal heaviness; (3) burning sensation in the epigastrium; (4) gnawing sensation; and (5) colic. Each variety was distinct and independent of the other; they were rarely associated together, and eventually, after becoming more constant and severe in intensity, culminated in definite attacks of colic.

1. *Abdominal distension.*—During meals the patient suddenly experienced a sensation of fulness and distension all over the abdomen, together with nausea and desire to eructate, lasting from a few minutes to several hours, and passing off quickly with possibly no recurrence for several days.

2. *Abdominal heaviness.*—In this variety a cold, weighty feeling was experienced in the lower abdomen, setting in soon after meals, causing a "bearing down" sensation and a desire to pass urine and flatus, both of which gave temporary relief.

3. *Burning sensation in the epigastrium.*—This symptom commenced as a raw burning sensation at the back of the throat, particularly in the early morning after drinking fluids, passing down behind the sternum, where it was frequently very acute, to the epigastrium, and through to the back between the shoulder blades; at times the diaphragm felt raw and tender, so that deep inspiration and coughing became painful. Loss of appetite, nausea, anorexia, with a sour clammy taste in the mouth, were usually present, as well as a desire to vomit and retch, which frequently resulted in the vomiting of glairy mucus having a very bitter, sour taste; rarely did the vomit contain food previously taken.

4. *Gnawing sensation.*—This commenced as a vague uncomfortable feeling all over the abdomen, occurring at irregular intervals, and frequently associated with general weariness and languor, seldom of sufficient severity for the patient to seek medical advice until the symptom became merged into a dragging, gnawing sensation, which usually became localised to the epigastrium or hypogastrium as the severity increased; it was usually likened to a tearing sensation, as if the bowels were being torn out or grasped by an unseen hand. This symptom was always worst from two to three hours after meals, and was accompanied by an intense craving for food or drink, which usually afforded instant relief for the time being. Exercise and exertion considerably aggravated the condition. A constant desire to pass flatus, to eructate, and to micturate attended this symptom, the least effort to do so being usually strained and very painful.

5. *Colic.*—The preceding symptom was the most frequent forerunner to definite attacks of acute colicky pain in the abdomen, which varied in character from a sharp stabbing, cutting pain to one of an acute twisting variety, as if the bowels were being nipped. The attacks usually came on quite suddenly and with such severity that the patient would roll about in considerable agony; the duration varied from a few minutes to several hours. The point of maximum intensity usually altered at each attack, the most frequent localities being around the umbilicus, the left iliac region, immediately above the pubes, and to the right of the epigastrium. During the attack the patient would break out into a cold, clammy perspiration, and present an anxious appearance, the temperature being usually subnormal and the pulse-rate slightly increased; a few cases only were observed in which the pulse-rate was under normal. When the pain was distinctly unilateral the pupil of the eye of the affected side was frequently noted to be contracted when compared with its fellow, and marked vagal tenderness upon the same side of the body was usually observed. The colic was often accompanied by vomiting, the vomit being bilious and containing a quantity of mucus. A constant desire to micturate, resulting in the voiding of a small quantity of urine, attended by considerable pain, was always present during an attack of colic. After the passing of the spasm the patient would fall into a sound sleep, and upon awaking the abdomen would be very tender to the touch, the pulse-rate usually above 100 per minute, and the temperature averaging 99° to 100° F.

Headache.

This was a frequent and troublesome symptom and in many instances the first and only subjective one for a considerable time. It was always attended by a sensation of lassitude, languor, and fatigue in the early stage; later general restlessness, irritability of temper, partial temporary loss of memory, attacks of dizziness occurring quite suddenly, slight dimness of vision, periods of insomnia, and hallucinations of sight and hearing were noticed. The pain usually remained localised to one of the following regions—viz., occipital, frontal, temporal, or vertex, and frequently depended in character upon its situation. The occipital variety was most intense over the occipital protuberance, radiating down into the muscles of the neck, and was of a dull aching character, often so intense as completely to invalid the sufferer. The frontal variety commenced as a slight feeling of heaviness behind the eyes, followed later by a sensation of constriction over the forehead. The temporal variety was more throbbing in character, usually accompanied by sharp, shooting, darting paroxysms, as if some instrument were being forced through the head from one side to the other. The vertex variety commenced with a feeling of heaviness, as if some heavy weight were resting upon the head, followed later by a "bursting open" sensation. The headache was usually very severe in the mornings, improving as the day went on, only to recur with a maximum intensity during the evening, vomiting frequently being present at the same time.

Anæmia.

This condition varied from a slight pallor of the conjunctiva and mucous membrane of the mouth—usually attended by a yellowish appearance of the conjunctiva and of the skin of the face—to an intense anæmia suggestive of malignancy. In the early stage microscopic examination of the blood did not show any marked change; in the later stages the erythrocytes were considerably diminished in number, and there was a corresponding diminution in the amount of hæmoglobin. Poikilocytosis was rarely seen, and in some instances there was a diminution in the polymorphonuclears and an increase in the lymphocytes. Thirty cases were carefully examined for the presence of basophile-staining granules in the red cells, with negative result. Sir Thomas Oliver was unable to find these cells in blood films taken from 10 of the cases presenting symptoms of all stages of lead intoxication. Dr. Kenneth W. Goadby, who also very kindly examined films from four of the patients, wrote me saying that he was unable to detect their presence. These observations tend to prove that basophilia as a sign of plumbism cannot be relied upon.

Nervous and Muscular Disorders.

While symptoms indicative of irritation of the nerve and muscle tissue were present in many of the cases only a few showed symptoms indicative of destruction of these tissues. The disorders of tactile sensibility were usually described by the patient as numbness and tingling, or "pins and needles" in the fingers and toes. The vaso-motor disorders consisted of cold hands and feet, and sometimes of hot, burning sensations in the extremities, especially after getting up in the early morning. At times the skin of the fingers and toes became quite white, or warm, livid, and moist. Profuse perspiration upon slight exertion was often noticed by the patient.

Muscular spasms.—These were often noticed, either in the form of tremors and twitchings of the extremities, or active cramps, most severe and persistent in the calves of the legs. These cramps were usually worst at night, preventing sleep, or in the early morning.

Sensory disorders.—These consisted of aching, burning, twisting or shooting pains in the limbs, with occasional paroxysms of excruciating lancinating pains, principally in the legs and feet. At one time the darting pains would be in the fingers, at another in the arms, at another in the legs; in other cases, again, the sensory branches of the intercostal nerves were implicated. In some cases the superficially situated nerve trunks, such as the ulnar, the musculo-spiral, or the popliteal nerves were unduly sensitive. A few cases showed slight cutaneous anæsthesia. In one patient who had complete ankle-drop and partial wrist-drop of both hands the anæsthesia was complete in the lower limbs as high as the knees, and in the upper limbs as high as the elbows. Muscular hyperæsthesia was frequently localised to the muscles of the legs.

Motor disorders.—Impairment of the muscular power of the muscles of the upper limbs was frequently noticed, the finer movements of the fingers and thumb being feebly performed, followed later by distinct weakness of the extensors of the wrist, patients often complaining that the grasping power had considerably diminished, and that they were afraid to carry any breakable object in case it suddenly fell from their hands. Two cases presented complete paralysis of the extensor muscles of the wrist and fingers of the right hand; in each case the paralysis became complete within three weeks of the patient first complaining of any symptom of plumbism. Although many suffered from weakness of the muscles of the legs, associated with exaggeration of the knee-jerk and of the plantar reflex, only one case of ankle-drop came under observation. Impairment of the muscles of the face was frequently noticed, as shown (1) by tremor of the lips, or on protrusion of the tongue; (2) by loss of expression, the lines which give character to the face being less marked or even obliterated. Two patients suffered from ptosis, one from nystagmus, and two from partial incontinence of urine and fæces.

Menstrual Disorders.

Dysmenorrhœa was very pronounced in many cases, frequently lasting a week, accompanied by a scanty flow. Other patients had intervals of amenorrhœa for several months, then one or two normal periods. The majority of the female patients suffered from profuse menorrhagia lasting in some instances for a period of three weeks.

Abortions.

Careful investigation failed to reveal an excessive number. In this series there were only five patients in whose urine lead had been found to be present who had suffered from abortions, one of whom had previously aborted three times in five years, another twice in three years.

Blue Line on Gums.

This sign depends largely upon the care devoted to the toilet of the mouth. Only two out of the 15 patients seen presenting a blue line were in the habit of brushing their teeth daily. The intensity of the sign bears no relationship to the severity of the symptoms. I have seen it very pronounced in persons suffering from quite trivial symptoms of plumbism, and I have even known of its existence previous to symptoms appearing. As only 15 patients in this series of 120 showed a blue line upon the gums, the absence of such sign is of little diagnostic value.

Constipation.

Although not a constant feature, many complained that their usual evacuation of the bowels was attended by more than the usual effort, and that they frequently had recourse to aperients. Those who suffered from costiveness in a marked degree frequently had attacks of spasmodic diarrhœa followed by obstinate constipation. Many cases were observed in which acute attacks of colic occurred after the exhibition of aperients amongst patients who had not previously suffered from abdominal trouble.

Convulsions.

Two cases of convulsions came under my notice, the patients being 65 and 18 years of age respectively. The former had 20 convulsive seizures extending over a period of 18 months; the latter six attacks in four months. They occurred quite suddenly without any previous warning, usually whilst the patient was walking about. Complete loss of consciousness was quickly followed by spasmodic twitching of the muscles of the face and limbs, usually unilateral. Respiration was at first quiet and sighing, later loud and stertorous, and at times intermittent; as the convulsive spasm passed off the breathing resumed the slow, shallow, sighing type. The pulse, which at the onset was fast and bounding, quickly became slow, intermittent, and at times hardly perceptible. The pupils of the eyes were usually dilated, fixed, and frequently unequal. Incontinence of the bladder and rectum usually took place during the attack. After the convulsion the patient would fall into a heavy sleep lasting several hours.

Albuminuria.

This sign was present in 20 cases, varying in amount from a mean trace up to 4 grammes per litre, estimated by Esbach's method.

The recognition of plumbism resulting from the absorption of lead gaining access into the system from the drinking of water which at times possesses plumbo-active properties may be one of considerable difficulty for the following reasons. 1. The amount of lead present in the water drawn from the household tap is usually small. 2. The poison being a cumulative one will necessarily cause the onset of symptoms to be slow and insidious. 3. Many of the symptoms of plumbism, especially in the early stages, are prone to simulate other diseases. 4. The absence of any conclusive sign or symptom, whereby incipient cases can be correctly diagnosed, excepting by the more or less costly clinical analysis of the urine or fæces. 5. Individuals suffering from plumbism do not necessarily excrete lead in the urine or fæces regularly. 6. The symptoms may continue for a long time after any lead can be detected in the excreta.

In each instance in the above series of 120 cases I based my diagnosis upon the presence of lead in the urine after submitting the urine to the following clinical examination.

100 c.c. urine and 10 c.c. pure redistilled nitric acid are evaporated in a porcelain basin to dryness; then ignited over a Bunsen burner until all organic matter is completely destroyed. The residue is dissolved in distilled water 3 c.c. + 2 c.c. HCl dil. pure, filtered into a test-tube, and an equal bulk of sulphuretted hydrogen is added. If no lead is present no change in colour will occur, and in its presence a brown colouration will be seen, varying in depth according to its amount.

Control examinations of 30 of the above cases were made for me by Messrs. Brady and Martin, of Newcastle-on-Tyne, confirming my results. The following two tests are worthy of note.

1. Paint the palm of the hand with a fresh solution of ammonium sulphide; in many cases the skin becomes black from the conversion of the lead excreted by the skin into lead sulphide, best seen upon the thenar eminence.

2. The saliva of a patient suffering from acute lead colic rarely contains any potassium sulphocyanate. On the addition of a few drops of liquor ferri perchloridi to the saliva of a healthy person a brownish-red ring appears where the two fluids meet. This is absent in the saliva in lead colic, but the sulphocyanate returns on the subsidence of the abdominal pain.

Guisborough.

LONDON HOSPITAL.—At an informal gathering of students in the college library on July 13th the prizes and certificates gained during the past session were distributed by Mr. E. Hurry Fenwick, consulting surgeon to the hospital. Price entrance scholarship in science, £100, C. S. Cloake. Price entrance scholarship in anatomy and physiology, £52 10*s.*, L. G. Jacob. Entrance scholarship in science, £50, G. Adler. Anatomy and physiology prize, £25, G. P. B. Huddy and A. G. Harsant (equal, prize divided). Letheby prizes: Organic chemistry, £10, G. Adler; honorary certificates, R. Theron and C. S. Cloake; inorganic chemistry, £15, M. Aronsohn; honorary certificates, — Seniyzky, I. H. Zortman, K. C. Beatty, and A. Eidinow. Prize in clinical medicine, £20, A. C. Perry; honorary certificates, F. H. Bray and C. P. Allingham. Prize in clinical surgery, £20, S. Batchelor. Prize in clinical obstetrics, £20, L. M. Ingle; honorary certificates, F. H. Bray and A. C. Perry. Hutchinson prize, £40, W. S. Perrin. Sutton prize in pathology, £20, F. H. Bray; honorary certificate, E. E. Herga. Andrew Clark prize, £26, A. C. Perry; honorary certificates, R. J. M. Love and E. E. Herga. Anderson prizes (three at £3), £9, E. Forrester Paton, G. P. B. Huddy, and D. C. Norris; honorary certificates, R. K. Ford and K. M. Ross. Dressers' prizes, £40: in-patients (four at £5), R. G. Sterling, H. W. Taylor, A. H. Morley, and H. W. L. Molesworth; out-patients (four at £5), E. B. Woolf, S. H. de G. Pritchard, H. P. Warren, and S. C. Woodhouse; honorary certificates, H. H. Bailey and D. F. Wilson. Practical anatomy prizes, £10, J. J. Murphy (£4), G. Adler (£2), G. Gluckman (£2), and H. B. Troup (£2). Douro Hoare prize, £5, H. H. Bailey; honorary certificates, F. G. L. Dawson and A. R. Crane. Wynne Baxter prize, £5 5*s.*, E. E. Herga, J. Fanstone.

FURTHER NOTE ON THE USE OF

CELLULOID SPLINTS IN THE TREATMENT OF ACUTE CASES OF POLIOMYELITIS.[1]

BY FREDERICK E. BATTEN, M.D. CANTAB.,
F.R.C.P. LOND.,
PHYSICIAN TO THE HOSPITAL FOR SICK CHILDREN, GREAT ORMOND-STREET, AND TO THE NATIONAL HOSPITAL FOR THE PARALYSED AND EPILEPTIC.

SOME three years have passed since I first made use of celluloid splints (which had been introduced into this country by Mr. H. J. Gauvain in the treatment of tuberculous disease of bones and joints) for the treatment of acute cases of poliomyelitis. Two years have elapsed since the publication of a note on this subject in THE LANCET, and it seems well to review the work of these two years. During this period ample opportunity has been afforded for testing the use and watching the effect of this mode of treatment.

From January, 1912, to December, 1913—i.e., two years—58 cases of poliomyelitis were admitted to the wards under my care. Of these, 32 were admitted within three months of the onset, and it is with these 32 cases that I wish to deal, for it is the early application of celluloid splints I consider important. Of these 32 cases 24 were splinted; the remaining 8 were either too extensively affected (both legs, arms, and trunk), or were cases of arm paralysis only, or had a distribution of paralysis which needed no splint or recovered so quickly that no splint was needed. Of the 24 splinted cases, in 3 recovery is now so far complete that no splint is needed. In the remainder splints are still required, but all are able to get about, either alone or with the aid of a push-cart. In several cases in which splints were at first required on both legs they now only require a single one below the knee to prevent foot-drop. In not one of all the cases recently seen or heard from has deformity arisen, but 3 have not been seen recently.

The more I see of this method the more convinced I am that it is a good one. I am perfectly aware that there is nothing new in splinting acute cases of poliomyelitis; it has been done in a variety of methods by various medical men for years. Some have advocated immobilisation in plaster-of-Paris, others have insisted on the immobilisation of the limb with complete relaxation of the paralysed muscles. All such immobilisation of the limb immobilises the patient, which in many cases is not only unnecessary, but gives no chance for physiological exercise of the muscles which are not paralysed. It is in the really acute cases—i.e., those seen within three months of the onset of the disease—that these splints have been of the greatest service, for they have kept the muscles at rest in a position of relaxation; they have prevented deformity and have enabled the patient to walk at an earlier period than would otherwise have been possible. The advantages of this form of splint are: (1) it fits the limb perfectly; (2) it is easily applied and removed; (3) it is light; (4) it is rigid; (5) it will not break easily; (6) any form of slipper, shoe, boot, or clog can be worn over it; (7) it is cheap; and (8) its manufacture is so simple that any one gifted with a little manual dexterity can make it. Many of the splints have been made by the sister in my ward and by my former house physicians, Dr. Cairns Terry and Dr. John Inkster, to all of whom I would tender my thanks not only for their work, but also for many improvements suggested by them. The splints are now made in separate departments of the hospitals. The process involved in making them is as follows: (1) the taking of the "negative" cast of the limb; (2) the making of the "positive"; and (3) the moulding of the splint on to the positive. It is the first of these points of procedure which it is essential for the medical man to perform, for unless the limb is in the right position the splint will be useless.

1. Certain articles are necessary for taking the cast of the limb—a strip of lead, 2–3 ft. long and 1 in. wide, some oil, some beeswax, a strong knife with a sharp point, and some plaster-of-Paris bandages. It is essential that the bandages should be properly made of book muslin, 4½ in. wide, 6 ft. long, loosely wound, and not too heavily loaded with plaster. The limb of which the cast is required is oiled, and if it be the leg a thin layer of beeswax is placed over the malleoli. The strip of lead is adjusted to the front of the leg. The leg is now held in position; *this is the most important detail in the whole process.* There should always be slight flexion at the knee-joint, and the foot should be carefully held at right angles to the tibia. It is most important that there should be no hyperextension of the knee or any dorsiflexion of the foot. Unless these two points are carefully attended to the patient will not only be uncomfortable, but will be unable to walk. The plaster-of-Paris bandages are now placed in warm water and after being squeezed out are wound round the limb, starting from the foot and working up the leg and thigh. It is best to take each bandage continuously up from the foot to the thigh, a few extra turns being needed over the knee and ankle. When the plaster has sufficiently set, which usually takes about 3–5 minutes after the last bandage has been applied, a cut is made down the anterior surface on to the lead. The incision must be complete and all fine threads divided, as otherwise the cast is liable to be spoilt by portions of the bandage being dragged out of place. The cut edges of the plaster are now separated and the lead and leg removed through the incision. The cut edges of the plaster are now brought together and a single layer of plaster-of-Paris bandage wound round the cast.

2. The "positive" cast is easily made from the "negative" in the ordinary manner by pouring in plaster-of-Paris, a stick being placed down the centre in order to make it easy to manipulate. After the plaster has firmly set, an incision is made down the anterior surface, the negative peeled off, and the positive removed.

3. *The moulding of the splint on the "positive."*—For making the splint the following articles are required: stockinette (made in the form of a tube, two or more inches wide), book muslin, solution of celluloid in acetone (Gauvain's[2] solution is as follows—11 oz. of celluloid, 160 oz. of acetone, to which is added while still hot 3 oz. of calcium chloride dissolved in 2 oz. of boiling water), celluloid varnish (cellulose triacetate 1 part, acetone 5 parts)—some braid for binding the splints, and some boot-hooks. The "positive" is well dusted with French chalk.

Method.—Three layers of stockinette are pulled on over the cast and on the third layer is painted a coat of the solution of celluloid; this is allowed to dry and then another layer of stockinette is pulled on; this in turn is painted with the solution of celluloid. In order, however, not to get the splint too thick on its anterior surface where it has to open to allow the leg being placed inside, and in order to make the splint sufficiently rigid to stand the weight of the body, layers of book muslin are placed down the back of the splint and painted on. It must be so arranged that in the anterior part of the splint there are some 5–6 layers, whilst at the back and sides there are 12–14 or more, depending on the size of the limb and the required strength of the splint. After the final layer of stockinette and celluloid solution has been applied a layer of celluloid varnish is painted on and the splint allowed to dry. Two incisions of about a quarter to half an inch apart are now made down the front of the splint and a strip about half an inch in breadth is removed. This allows the "positive" on which the splint has been made to be taken out and the inner layer of stockinette, which has not become impregnated with solution, is removed. The inner surface of the splint is now painted with the celluloid solution. The splint is now ready for fitting on to the patient. If the cast has been well made it usually fits perfectly, and only some small amount may need to be cut away about the knee and ankle so as to allow easy application and removal. The splint is now bound round with leather or braid, the latter being painted over with celluloid varnish and some boot hooks inserted.

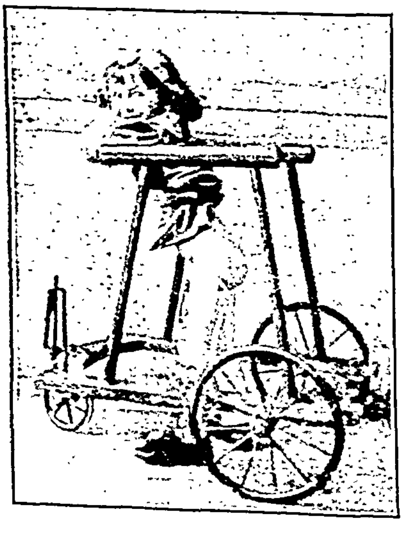
---

[1] The previous article on this subject was published in THE LANCET of July 13th, 1912, p. [illegible]

[2] Brit. Med. Jour., [illegible]

Method of application and use.—It is necessary to say a few words about the application, for unless this splint is rightly applied it will be uncomfortable, will cause pressure sores, and will therefore be said to be useless. The skin of the limb is dusted with powder and a thin stocking or stockinette put on. The splint is now opened in front and the limb dropped into place. It is essential to see that the heel is down and the malleoli are in their right situation. In early and acute cases—i.e., in cases within the first four weeks of onset—the splint should be worn day and night and only removed for washing and for such methods of treatment as may be considered desirable. After the end of the first month it is usually possible for the patient gradually to get into the erect position and make the early attempts to walk. (This is greatly assisted by a walking apparatus (Fig. 1). For this purpose a stocking is drawn over the splint and an ordinary shoe, rubber sand shoe, or boot worn. In the country children can wear clogs, and these serve the purpose of protecting the splint and keeping the feet dry. If clogs are used a fairly thick stocking should be worn between the clog and the splint.

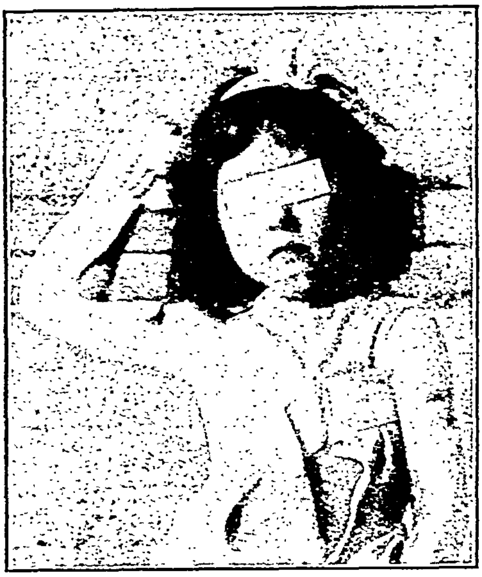
FIG. 1.



Child with flaccid paralysis of both legs and weakness of the muscles of the back in celluloid splints in walking apparatus.

Cases suitable for splinting.—Almost any case of paralysis of the lower limbs is suitable for this form of splinting, but those with weakness of the lower dorsal, lumbar, and pelvic muscles are difficult to deal with. In cases of paralysis of the shoulder muscles the arm can be placed in the position shown in Fig. 2, which serves to keep the deltoid and biceps relaxed. Thoracic and abdominal cases can be splinted in this manner, but it has little advantage over other methods of giving support to the back and trunk muscles.

FIG. 2.



Child with flaccid paralysis of deltoid, biceps, and muscles of the right arm. The arm is placed in a celluloid splint, which keeps it in an abducted and flexed position.

Conclusions.—The object of this note is to show that early splinting of cases of acute poliomyelitis with celluloid splints is attended with good results, in that it has aided the recovery of the paralysed muscles by keeping them at rest, that it has prevented deformity, and has enabled the patient to walk.

Of the 24 cases of acute poliomyelitis seen and treated within three months of the onset, in 21 it is known that no malposition has arisen; three cases have not been seen recently, so no positive statement can be made in regard to them. In one severe case, after wearing splints for a year, recovery was so far complete that splints were no longer required, and a year later it was difficult to say that there was any residual paralysis. It is fully recognised that this is fortuitous, and under other forms of treatment the boy might have made an equally good recovery, but it seems certain that his recovery was greatly assisted by the prevention of deformity in the early stage of the disease. Of the remaining cases, all have still varying degrees of weakness, but are all able to get about and have no malposition of the limb.

EPIDEMIC CATARRHAL JAUNDICE.

By E. A. COCKAYNE, M.D. OXON., M.R.C.P. LOND.,
ASSISTANT PHYSICIAN TO THE MIDDLESEX HOSPITAL; PHYSICIAN TO OUT-PATIENTS, VICTORIA HOSPITAL FOR CHILDREN, CHELSEA.

IN September, 1913, after seeing no cases of catarrhal jaundice since the early spring, I began to meet with them amongst my out-patients, and they were fairly numerous until the middle of March, 1914, but for the last three months I have seen none. By making inquiries about the possibility of contact with other cases I found that in two instances they had occurred in connexion with definite epidemics.

In 1912 I published a paper on this subject in the *Quarterly Journal of Medicine* in which I tried to prove that catarrhal jaundice should be classed with measles and mumps as one of the specific infectious diseases due to an unknown organism, and that it should be regarded as an infective hepatitis. I am convinced more than ever that this is a correct view, and have been supported by Dr. Leonard Guthrie in a paper read before the Section for the Study of Disease in Children of the Royal Society of Medicine. I will not repeat all the arguments there brought forward, but will content myself by giving a few of the most striking.

The disease has an almost worldwide distribution, a definite seasonal and age incidence, and is commoner in some seasons than others. The fact that one attack confers immunity for life also points to its specific nature. Fewer than 40 epidemics have been described in this country, but when the view that the disease is not an incident in a non-specific gastro-enteritis is less widely held, small epidemics will probably be found to be fairly common, and small groups of two or three cases will be noticed still more frequently. I pointed out that though the clinical features of sporadic cases vary to some extent, none are met with which are not also seen in the epidemics and *vice versa;* the ages and seasonal incidence show a very close parallel, and the geographical distribution of epidemics closely follows that of sporadic catarrhal jaundice, though it is not quite so extensive. No doubt the gaps will soon be filled when greater interest is aroused; for instance, though the sporadic form is met with, no epidemics have been recorded from Canada, but Dr. C. H. Reason told me a few months ago that he met with one affecting about 20 children near Toronto.

It is still an open question whether the disease is a local one of the bile-ducts and liver or a general blood infection. With growing knowledge many diseases formerly regarded amongst the former class are now placed in the latter, and several considerations suggest that this should be one of them. Such are the prodromal period of malaise with pains in the head and limbs, the enlargement of the spleen, and the albuminuria, which are frequent in some epidemics, and also occur in isolated cases. The rare fatal cases met with in epidemics are inseparable on clinical and pathological grounds from acute yellow atrophy of the liver, and the seasonal incidence of this disease appears to be the same. It is noteworthy that three cases have occurred in London at the end of 1913 and the beginning of 1914, during the time catarrhal jaundice has been unusually common, one in a child recorded by Dr. J. Porter Parkinson, and two in adults by Dr. W. Brander and Mr. G. L. Keynes.

Recently collected evidence seems to prove that the disease is contracted by breathing in air containing the organism, and close contact is necessary. In a few cases I have noticed a definite pharyngitis, and I published some instances in 1912. In 1913 I met with another example in a girl aged 5½ years. She had pharyngitis and slight malaise on Nov. 4th, and on the 15th urticaria began, such that the mother said "she could not bear herself." On the 18th she vomited twice, and jaundice appeared on the 19th and lasted until the 26th. Sore-throat with marked redness of the pharynx was noticed in one of the epidemic cases (Table II., Case 4). Ralph Poignard noticed slight pharyngitis in every case in a small epidemic in children between the ages of 6 and 12 years. Dr. Cameron Gibson, who has recently published a paper, noticed sore-throat with symptoms of a "cold" in one case, and says that there were an unusual number of cases of pharyngitis in children during epidemics of jaundice at Lymm and Bickerton. This suggests that the tonsils and pharynx are the portals of entry of the infecting organisms, as in so many specific fevers, though they do not necessarily cause a recognisable inflammation of the tissues during their passage.

Several interesting points are brought out in the two epidemics which I have just seen. The first occurred at the Algernon-road School, Hendon. In this 10 children were attacked, 4 boys and 6 girls. The first case occurred in one of the older children; all the rest in the children attending the infants' department. Boys and girls are taught together, but the buildings for the older children and infants are in separate blocks at opposite ends of the playground.

The district is a somewhat isolated one and the children attending the school have clean and comfortable homes. West Hendon is supplied by two water companies, the Colne Valley and the West Middlesex, and about half the children affected come from houses supplied by the one and about half from those supplied by the other. Nor did the children have milk from a common source. Water is supplied at the school, but while the epidemic was in progress the weather was cold and most of the children live very near the school, so that little water was being drunk. Inquiry also showed that some of the affected children had not been using it at all. This disposes of the possibility that water or milk could have conveyed the infection. Many of the children attacked were members of the same class and, after the first case, all were infants.

TABLE I.—*Giving Particulars of 10 Cases of Catarrhal Jaundice occurring in the Algernon-road School, Hendon.*

No.	Sex and age.	Date of absence from school.	No.	Sex and age.	Date of absence from school.
1	F., 9	Dec. 1 to Dec. 25.	6	M., 5	Jan. 7 to Jan. 19.
2	F., 6	,, 11 ,, Jan. 7.	7	F., 6	,, 9 ,, ,, 19.
3	M., 5	,, 17 ,, ,, 7.	8	M., 5	,, 16
4	F., 6	,, 31 ,, ,, 19.	9	M., 6	Feb. 11 ,, Feb. 27.
5	F., 6	Jan. 7 ,, ,, 19.	10	F., 7	Mar. 2 ,, Mar. 31.

There is little doubt that the disease was conveyed from child to child by the air, while they were in school, or in the room in which hats and coats were hung. There was no influenza, typhoid, or other kind of illness affecting the school or neighbourhood at the time, and there were no cases of catarrhal jaundice in the other schools of the district or amongst the general population round about.

Dr. M. I. Baker, who attended all the cases except two, which I saw myself, says they were mild with one exception. In this case there was severe initial vomiting, and pyrexia, 101° F. for four days. The urine contained a trace of albumin, which disappeared after a fortnight. There was a good deal of pain in the hepatic region and the liver was enlarged. In the two cases which I treated the temperatures were 98·4° and 98·8° F., and the pulse-rates 102 and 104 *respectively*, though bile salts as well as bile pigment were present in the urine. I have several times found a quickened pulse during the time bile salts were present in the urine, and in common with all other observers have failed to find slowing of the pulse in catarrhal jaundice in children. The liver was enlarged in both cases, but the spleen was not palpable. As the jaundice was disappearing the girl patient complained of itching when warm in bed, an unusual symptom in a child in the absence of urticaria.

There were no prodromal symptoms in any of the cases; there were nausea, vomiting, and anorexia about two days before the jaundice was evident, but at this stage the liver is presumably already inflamed.

One child complained spontaneously of xanthopsia, an interesting symptom and one whose occurrence has been denied by some authors.

The second epidemic, which differed considerably from the first, was at the Bridge School, Wealdstone, about five miles away from the Hendon school. Twelve school children were affected, and three mothers and four younger children caught the infection from children attending the school. There were no cases in other schools of the district, nor any isolated cases, so far as could be discovered, nor could any connexion between the two outbreaks be established.

Table II. gives the age, sex, and class of each child and the clinical details which were procurable. Great interest attaches to the rapidity with which the epidemic spread. All the 12 children were attacked within a period of 12 days, and the incubation period must have been very short (1, 2, and 3 days); whereas in the Hendon epidemic between the first and second cases there was an interval of 10 days, and between the cases of the brother and sister attacked (the latter probably infected by the former) 14 days; between the eighth and ninth and ninth and tenth cases, 26 and 19 days respectively elapsed. The longer incubation period may have been correlated with the lesser virulence. When I had the disease myself the incubation period cannot have been longer than three or four days. Cameron Gibson gives 3–14 days, but noticed intervals of 27 and 47 days in two instances. The very long intervals sometimes noticed may be explained by abortive cases being overlooked, or by the virus remaining active in a room and infecting a child indirectly.

In the Wealdstone school the girls have the upper floor, a central hall with class-rooms round it, and the boys the lower, to which a separate staircase gives access. There are no mixed classes. The first four cases occurred in one class-room, and affected children sitting at desks placed next to one another. Fringuet noticed a parallel phenomenon in a school epidemic, in which three boys and two girls, who sat at neighbouring desks, were attacked in turn.

Here again the general water-supply cannot be incriminated, and at the school little water was being drunk, and in any case the boys seldom use the cup provided, usually drinking it from their hands. With one exception the homes of the children attacked were good ones.

In this epidemic the first, sixth, eighth, and tenth, and possibly the twelfth, cases must have been abortive ones—namely, cases in which no jaundice developed. In one of these it was proved that the child had the disease, for he gave it to his mother and brother at home, and they developed the typical jaundice. On the analogy of other epidemic diseases such cases would be expected to occur, but they are either unusual or more probably overlooked.

TABLE II.—*Giving Particulars of 12 Cases of Catarrhal Jaundice occurring in Bridge School, Wealdstone.*

Case.	Sex and age.	No. of form.	Date of onset.	Other cases in same house.	Character of illness.
1	F., 8	2A	Feb. 25	—	Vomited for several hours, bringing up green mucus. Headache an dizziness; no jaundice.
2	F., 8	2A	Feb. 26	Mother and 3 younger children.	Sudden onset with severe vomiting of yellow mucus, rigors and pyrexia Pain in hepatic region. Furred tongue and sordes *on* lips; deep jaundice. Loss of weight, prolonged convalescence. Mother also had severe attack.
3	F., 7	2A	„ 27	—	Feb. 27: Malaise. Feb. 28: Jaundice of conjunctivæ. March 1: Deep jaundice for 3 weeks. March 4: Much bile *pigment*; *trace* of bile salts in urine; albuminuria. Liver two fingers' breadth below costal margin. *Spleen not felt.* *Hereditary* ichthyosis of skin; on appearance of jaundice some itching. Six weeks after onset still easily tired.
4	F., 8	2A	Mar. 2	—	Nausea, no vomiting; sore-throat; furred tongue. Jaundice lasted about a fortnight.
5	M., 11	2	„ 2	Mother.	Vomiting, dizziness, and headache. Sordes on lips. Slight jaundice of conjunctivæ. Mother had slight attack some days later.
6	M., 9		„ 2	—	Headache; some pain in hepatic region; no jaundice.
7	M., 8	5	„ 3	—	Vomiting of green mucus; headache; slight jaundice of conjunctivæ.
8	M., 9	4	„ 4	—	Vomiting of green mucus; headache; no jaundice.
9	M., 10	4	„ 4	Mother and brother.	Giddiness; headache; no vomiting; no jaundice. Mother and brother developed slight jaundice.
10	F., 7	2A	„ 4	—	Headache; dizziness; vomited yellow mucus; slight pyrexia; no jaundice.
11	F., 9	3A	„ 6	—	Vomited mucus and bile; slight pyrexia; slight jaundice of conjunctivæ and skin.
12	M., 9	4	„ 9	—	Nausea; no headache; no vomiting; jaundice doubtful.

The rather numerous cases of gastro-enteritis noticed during the Bloemfontein epidemic were probably abortive cases; the cases of pharyngitis noticed by Cameron Gibson may have been, though this is less probable. One case was noted by Falkner at Toowomba. Apart from these I can find no record of any in the various epidemics at home or abroad. The Wealdstone epidemic establishes their occurrence on a firmer basis than before.

The disease appears to be most infectious in the prodromal period and in the early stages, but the virus may remain active and be transported to a distance. Instances of spread by this means have occurred several times, and a good example was published recently by Prosper Merklen under the title of "emotional jaundice." A girl was run into by a bicycle on Dec. 3rd, 1910. On the 5th she had headache, nausea, and a temperature of 38·4° C., and on the 6th jaundice. The jaundice only lasted seven or eight days, and on the 27th she went to stay with an uncle in the country in a household where there were four children. Two of these contracted the disease in a more severe form, one becoming ill on Jan. 8th and one on Jan. 17th, 1911. Another example of the virus remaining active was one I met with in 1912. In a family of 18 members the youngest child, aged 3 years, had catarrhal jaundice on March 6th, and six weeks later, on April 17th, the next youngest, a girl, aged 5½ years, was attacked. Schneekloth records that in a family two girls fell ill at eight days' interval, and an infant three months later. Krasnobaeff states that three brothers were attacked at intervals of three or four weeks, and then it was discovered that a child with jaundice had lived for a few days in the room at which they stayed. This proves conclusively that the virus can persist outside the body, though it is not improbable that carriers may play an important part in its dissemination.

Dr. Gibson thinks that there are two specific diseases described under the name "epidemic catarrhal jaundice," one attacking children and rarely affecting adults, the other affecting adults. It seems much more probable that the disease is usually confined almost entirely to people of one age owing to its slight infectivity. It attacks one form in a day school or one house in a boarding school. For instance, several boys in the sixth form of a public school were attacked two years ago, and none in any other form. In another, adults of similar age alone may be attacked as in the French barrack epidemics, in which young recruits usually suffer and in which a few of the dormitories alone are affected, but in one of which at least only old soldiers were attacked and the outbreak was confined to their special quarters. It is only in extensive epidemics that people of all ages are attacked.

The one possible mode of spread, except by the air, which would explain these epidemics, is by means of some biting insect. Mosquitoes, flies, and midges are excluded by the fact that it is not a summer disease; bedbugs and pediculi by the fact that it is as common amongst the better classes as amongst the poor. Fleas are unlikely to be the cause for the same reason, and in some instances I have been able to exclude them so far as they can be excluded. It is also unlikely because fleas are most common in July, August, September, and October, and least common in January, February, and March, the months in which catarrhal jaundice is most prevalent.

No other infectious disease was prevalent during either of these two epidemics, and they add to the evidence, which is steadily accumulating, that the disease is quite distinct and not merely a peculiar form of influenza, paratyphoid, or typhoid fever. I have advanced reasons elsewhere for attributing its occasional association with these diseases to coincidence. In one of my cases I had Widal's reaction done a fortnight after the jaundice had disappeared and it was negative. The positive agglutination tests with the bacillus typhosus and paratyphosus are probably due to the presence of bile in the blood, and no weight should be attached to a positive result until this is no longer present.

During the discussion on Dr. Guthrie's paper, already mentioned, Dr. R. C. Jewesbury mentioned the occurrence of epidemic jaundice in dogs. This was formerly held to be a severe form of distemper comparable to the jaundice which appears in the bad cases of yellow fever and relapsing fever, but it is more probably a distinct disease. Mr. Henry Gray gives an account of it in Hoare's "Text-book of Veterinary Medicine." He tells me that it is rarely seen in London, but that it occurs rather commonly in sporting dogs, especially after they have been in damp thickets, and causes a very heavy mortality. He is inclined to think that it is allied to or identical with the malignant jaundice investigated by Nuttall and proved to be due to a protozoon, piroplasma canis, conveyed by the bite of a tick. There seems to be no likelihood that it is the same disease which attacks man, and I can find no evidence that epidemics in man and in dog have occurred together.

In conclusion, I should like to thank Dr. C. W. F. Young and his assistant, Dr. R. A. Askins, Dr. Scanlan, and Dr. Baker, and also the head masters and mistresses of the schools, for the great trouble they took in supplying me with information.

Harley-street, W.

SOME PROBLEMS IN CARDIAC PHYSIOLOGY:

CONTRIBUTIONS TO A STUDY OF THE RELATIONS WHICH EXIST BETWEEN THE VARIOUS CHAMBERS OF THE MAMMALIAN HEART.[1]

BY A. F. STANLEY KENT, M.A. OXON.,
HENRY OVERTON WILLS PROFESSOR OF PHYSIOLOGY IN THE UNIVERSITY OF BRISTOL.

PROBABLY all here are familiar with the history of the subject of this lecture, and are aware that before 1892 it was impossible to explain the action of the mammalian heart on the comparatively simple lines found adequate in the case of the heart of the frog, owing to the fact that any muscular connexion between auricle and ventricle in the mammal was absolutely denied. In 1892 it was shown that this idea was erroneous and that muscular connexion between auricle and ventricle did as a fact exist. In the following years the details of the connexion were worked out by various observers, and the band of tissue is now familiar to everyone as the auriculo-ventricular bundle. As is often the case with new knowledge, it was some time before the existence of the auriculo-ventricular bundle was used in explaining symptoms presented by clinical cases. Within the last few years, however, its importance has been fully recognised, and its presence has generally been referred to in explaining certain forms of cardiac irregularity. Certain difficulties have arisen in connexion with these explanations from time to time, and some have doubted whether the case really is as simple as it appears. Clinical experience and experimental results have sometimes thrown doubt on the explanation put forward. The difficulties are of the following kind. Cases have occurred in which—if the published records are to be trusted—an interruption of the normal rhythm of the heart has been observed, although the auriculo-ventricular bundle has proved to be intact; and cases of normal rhythm have occurred in which the bundle was subsequently found to be destroyed. Many of these difficulties may be capable of solution. Some of them, however, appear to be insoluble.

---

[1] A lecture delivered before the University of London at South Kensington on June [illegible], 1914.

So long ago as 1892 I described the existence of additional muscular connexion between the auricle and ventricle in the right lateral wall of the heart, and although this observation excited little attention at the time, it lived in the memory of some workers in cardiac physiology, and was sometimes glanced at as likely to afford a possible explanation of puzzling experimental results. My own work on the heart was unavoidably interrupted for some time, and it is only within the last three or four years that I have been able to return to it. The position was found to be as described. The presence of the auriculo-ventricular bundle was acknowledged, and it was regarded as the one and only path of muscular conduction between auricle and ventricle. And yet it was not adequate to explain the facts found clinically and experimentally.

The problems which presented themselves for solution, therefore, were the following:—

1. Do there exist anatomical paths of muscular connexion between auricle and ventricle other than the auriculo-ventricular bundle?

2. If such additional paths exist, what are their number, situation, structure, and connexions?

3. Are such paths—provided they exist—capable of forming a physiological connexion between the auricle and ventricle?

It appeared best to carry out the histological part of an investigation of this kind upon human material, as the labour involved would in any case be very great, and the whole of the work would have required to be repeated had other material been used. Such a selection made the work more difficult, as it is always troublesome to obtain human material sufficiently fresh to make good preparations. This and other difficulties were ultimately surmounted, however, and a minute examination of the whole of the auriculo-ventricular connexion was commenced. The method adopted was as follows. The whole of the auriculo-ventricular ring of the heart was divided up into blocks, and each block in turn was cut into sections. The sections were floated on to glass, stained, mounted, and examined. The stains found most generally useful were the connective tissue stain of Mallory, Heidenhain's iron hæmatoxylin, hæmatoxylin and safranin, and various modifications of the silver impregnation method. Stress should be laid on the fact that in the systematic examination of the ring every section in the series was stained and examined. In some researches it has appeared that not every section, but every alternate section, or even every third or fourth, has been examined. If it is desired to exclude once for all the possibility of the existence of any extra connexion it is obviously necessary that every section shall be examined. Many of the original series of sections have been repeated, sometimes again and again, for the purpose of confirming or of correcting the earlier results. Some of the more important conclusions are the following:—

1. *Neuro-muscular structures.*—There exist in the heart in the neighbourhood of the auriculo-ventricular groove on the left side of the organ neuro-muscular structures whose constituents are partly nervous and partly muscular, and which have connexions with the nervous structures of the groove and with the muscular tissue of auricle and of ventricle.

2. *Nodal tissue.*—There exists in the right lateral wall of the heart a mass of hitherto undescribed nodal tissue.

3. *Muscular connexions.*—In association with the second conclusion there exists at least one muscular path between auricle and ventricle along which impulses can pass, and which is able to keep the chambers in physiological association, even when the auriculo-ventricular bundle has been cut.

4. *Paths of physiological conduction.*—Experimental results have been obtained which completely bear out the anatomical fact of the existence of an additional muscular path between auricle and ventricle.

1. *Neuro-muscular Structures.*

The neuro-muscular structures can be described best by referring to the appearances which are found successively when a series of sections is examined. The structures lie in the connective tissue at the base of the auricle or ventricle. The first indication of their presence is the appearance of a few nerve fibres of small size amongst the connective tissue bundles. A few sections further on it is seen that the number of fibres has increased, and soon connective tissue is seen to be arranged round the group and to be forming a sheath for it. As the series of sections is followed the group of fibres becomes larger, and may attain a diameter of 170 mu. It now appears as a well-developed bundle of fibres surrounded by a well-formed capsule of connective tissue, inside which a definite and large lymph space can often be distinguished. If the bundle be followed further it will be seen that its constituents are changing. Instead of the nervous fibres forming the only kind of tissue present there are now more darkly staining fibres which can be recognised as muscle, very similar to the fibres of the neighbouring auricle or ventricle. Some, however, have different characters, appear at first sight to be tubular, and prove on closer examination to be composed of more or less structureless protoplasm in the centre, with striation and indication of sarcostyles at the periphery. These fibres bear some resemblance to the fibres of Purkinje found elsewhere in the heart.

The amount of muscle in the bundle gradually increases and may become large, whilst at some part of its course muscle fibres are given off from the bundle and become connected with the neighbouring auricular tissue. In other situations some of the nerve fibres may be seen to leave the bundle, and apparently to become connected with nervous structures lying in the connective tissue of the groove. Throughout their course these bundles are provided with a rich supply of blood-vessels. The complete organ then presents itself as a spindle-shaped mass commencing with a few nerve fibres of small size, increasing to a bundle of perhaps 170 mu. in diameter and somewhat resembling a nerve trunk, and richly supplied with blood. Soon muscle appears amongst the nerve fibres, assumes considerable proportions, and ultimately becomes connected with neighbouring muscular masses. The nerve fibres also appear to become connected with neighbouring nervous masses. The bundle is contained in a connective sheath in which lymph spaces may be seen.

2. *Nodal Tissue.*

This—the second structure to be described—is found in a different part of the heart wall. It is found in the auricular wall at a point almost on the extreme right lateral aspect of the heart, slightly towards the posterior surface. Amongst the bundles of auricular muscle in this situation will be observed a more circumscribed mass, partly surrounded by fibrous connective tissue, and in free communication with the rest of the auricular muscle. The mass may be nearly circular in outline, or it may be distinctly olive-shaped. In either case it is seen to consist of an outer part which is similar to normal muscle, and a central portion which shows modifications of the kind usually associated with nodal tissue. The tissue stains differently, its fibres are often exceedingly fine and show rich branching, and the cross striation is not very easily seen. The blood-supply is rich.

3. *Muscular Connexion.*

Associated with the presence of this nodal tissue is the existence of a muscular path leading from the auricle to the ventricle and forming a channel along which impulses are able to travel. This path is found at the lower part of the mass of nodal tissue, and is formed by the passage of strands of ventricular fibres derived from two or three different layers of the ventricular wall upwards and outwards until they come into association with the tissue of the node. Thus the node is, as it were, interposed in the course of the muscular path between auricle and ventricle, and any impulse passing from auricle to ventricle would necessarily pass through the tissue of the node. The need for such an arrangement is apparent when the physiological conditions are considered. For, as suggested in 1892, the interposition of the fine fibres of the node with their altered character results in a slowing of the rate at which the impulse travels, and thus the pause between the auricular and the ventricular contraction is brought about.

4. *Experimental Results.*

That the existence of such a channel of communication between the auricle and the ventricle will render necessary important alterations in our ideas of the mechanism of the coördination of the action of these chambers is obvious. For if, contrary to preconceived ideas, the auriculo-ventricular bundle is not as a matter of fact the sole muscular path along which impulses may pass from auricle to ventricle, its destruction does not necessarily involve the interruption of such passage, and clinical cases and experimental results—hitherto difficult of interpretation—become intelligible. Direct experimental results are, therefore, of especial interest.

The following experiments, amongst others, have been carried out. In the exposed heart of the mammal the bundle has been cut and electrocardiograms have been taken subsequently. These showed that the rhythm between auricle and ventricle persisted.

The experiments performed by Flack and Leonard Hill showed that there existed at the right lateral region of the heart a mechanism which under certain circumstances was capable of affecting the auriculo-ventricular rhythm.

More recently I have carried out the following experiments directed especially to the clearing up of the question. The method adopted was simple. In the beating heart of the mammal a thin knife was passed through the right ventricle near the groove, and brought out in such a way as to sever completely the auricles from the ventricles with the exception of a strip of tissue at the right side of the heart. Under these conditions it is found that beats arising spontaneously in the right auricle pass through to the ventricle and evoke ventricular beats, and, after the heart has ceased to beat spontaneously, beats excited artificially in the auricle still pass through to the ventricle and give rise to ventricular beats.

Since under these conditions the only tissue connecting the auricle to the ventricle is the strip at the right side of the heart, and the histological part of the inquiry has already shown that an anatomical connexion exists in this situation, it is impossible to avoid the conclusion that in this right lateral auriculo-ventricular junction there exists a muscular path capable of transmitting impulses and of coördinating the action of the chambers of the heart.

Further, since, as has been shown, the muscular path is completed by the interposition of a mass of nodal tissue through which the impulses must pass, it is clear that the conditions here are similar to those found in the case of the auriculo-ventricular bundle, and that the auriculo-ventricular pause may be explained on similar lines—i.e., as being due to the passage of the impulse over tissue modified histologically and physiologically with a resulting delay in conduction.

It is clear that the above considerations must exercise a considerable influence upon the nature of our explanation of cardiac action.

[The lecture was illustrated by numerous lantern slides, drawings, photographs, and preparations.]

Bristol.

A CASE OF

TUBERCULOUS DISEASE OF VERTEBRÆ

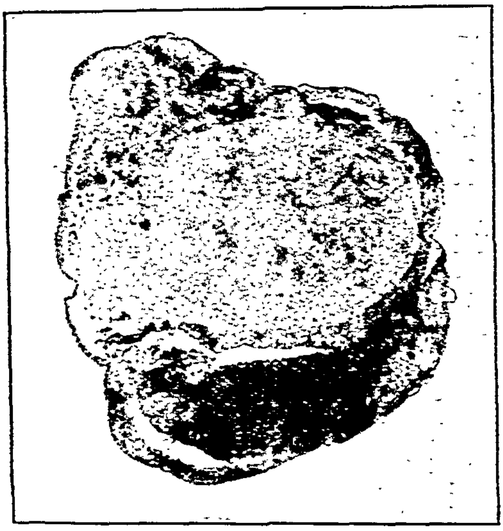
COMPLICATED BY AN EXTENSIVE ACUTE SUPPURATIVE MENINGITIS.

BY JAMES MILLER, M.D. EDIN., F.R.C.P. EDIN.,
LECTURER ON PATHOLOGY AND BACTERIOLOGY AT THE SCHOOL OF MEDICINE OF THE ROYAL COLLEGES, EDINBURGH;
AND
A. FERGUS HEWAT, M.B., CH.B. EDIN., M.R.C.P. EDIN.,
TUTOR IN CLINICAL MEDICINE, UNIVERSITY OF EDINBURGH; LECTURER, EDINBURGH POST-GRADUATE VACATION COURSE.

THE following case, which we are enabled to report through the kindness of Dr. Harry Rainy and Dr. Theodore Shennan, shows certain features of clinical and pathological interest.

Clinical history.—The patient, 22 years of age, was seen by one of us after he had developed symptoms of acute meningitis. We were able to elicit the following history from his relatives. In June, 1912, the patient had complained of vague pains in his back, and in consequence had consulted his private medical attendant, who examined him most carefully. Nothing definite could be made out, and he was advised to return if any further symptoms developed. This he did not do. At the end of September, 1912, he is reported to have strained his back, and at the same time an abscess burst posteriorly and developed into a running sore. He was living in the country at the time and was sent to the Edinburgh Royal Infirmary, where he was seen by one of the charge surgeons who diagnosed the condition to be a typical case of Pott's disease accompanied by a ruptured cold abscess. He was treated along the usual lines and he improved vastly, the ulcer almost completely healing up. After this he tried unsuccessfully to find work. On Dec. 2nd, 1912, he retired to bed complaining of feeling giddy and sick, with some headache. He made no complaint of pain in his back. About 3 o'clock next morning he vomited and became very restless. He appeared to be insensible to what was said to him. Three hours later he vomited several times and complained in a vague way about pain in his forehead. General irritability was very pronounced. He was sent to the Edinburgh Royal Infirmary forthwith.

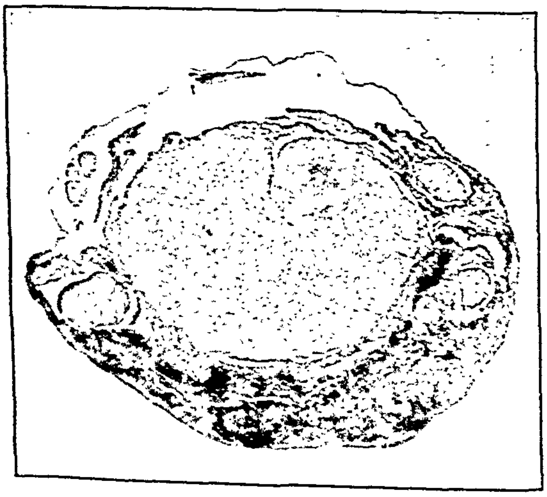
FIG. 1.



Section of spinal cord and meninges in cervical region.

Physical examination on admission.—The patient showed signs of cerebral irritation. At times he lay on his side, and then would roll from side to side. The lower limbs were drawn up. The arms were at times folded across the chest, and then he made purposeless movements in the air. His eyes were half closed and he mumbled inarticulate words. The abdomen showed no retraction and tache cérébrale was absent. Temperature, 100·5° F.; pulse, 96.

FIG. 2.

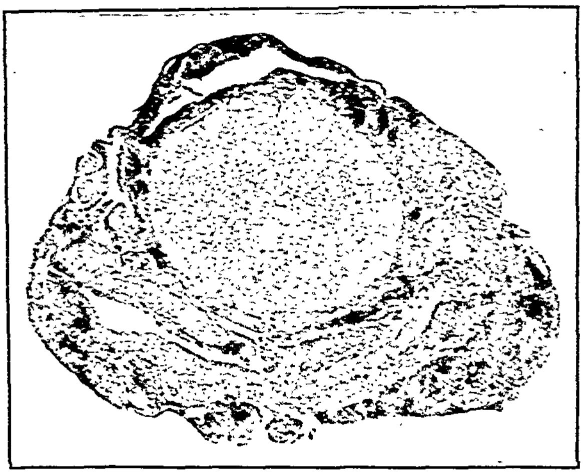


Section in lumbar region.

He was in a semi-conscious state, but was able to swallow milk and other fluids. As far as one could test the function of the cranial nerves, there seemed to be no definite impairment of function. Motor power was impaired all over. He was extremely sensitive to stimuli of all kinds. Considerable photophobia was present. Reflexes: abdominal and epigastric absent on both sides; plantar, flexion on both sides. Achilles and knee-jerks were slightly increased. The latter were difficult to elicit because of the tightening of the hamstrings. Kernig's sign was markedly positive. No rash on the skin was visible. The heart was slightly dilated; the sounds were closed but soft. He flushed frequently, and his vasomotor control was much impaired. Lungs: some apical impairment on both sides with harsh breath sounds. The rest of the lungs appeared normal. The tongue was dirty. Anterior abdominal muscles were rather tense, but no definite boarding could be made out. The bowels were constipated. The stomach, the liver, and the spleen were not enlarged. The urine was high coloured with urates. There was no albumin or sugar. A discharging wound was situated on the back, just below the level of the crest of the ilium, about one and a half inches from the middle line on the left side. The sinus ran in an upward and inward direction.

Treatment and progress.—The patient was placed on a water bed and given milk every four hours. Lumbar puncture was performed and thinly purulent cerebro-spinal fluid came out under tension. This was found to contain capsulated streptococci in short chains. They retained Gram stain. The patient was given urotropine gr. xv. every four hours and an analgesic powder. Dec. 5th: The patient was very restless all night and did not react to large doses of bromide and chloral. The bowels were freely moved which gave some relief.

FIG. 3.



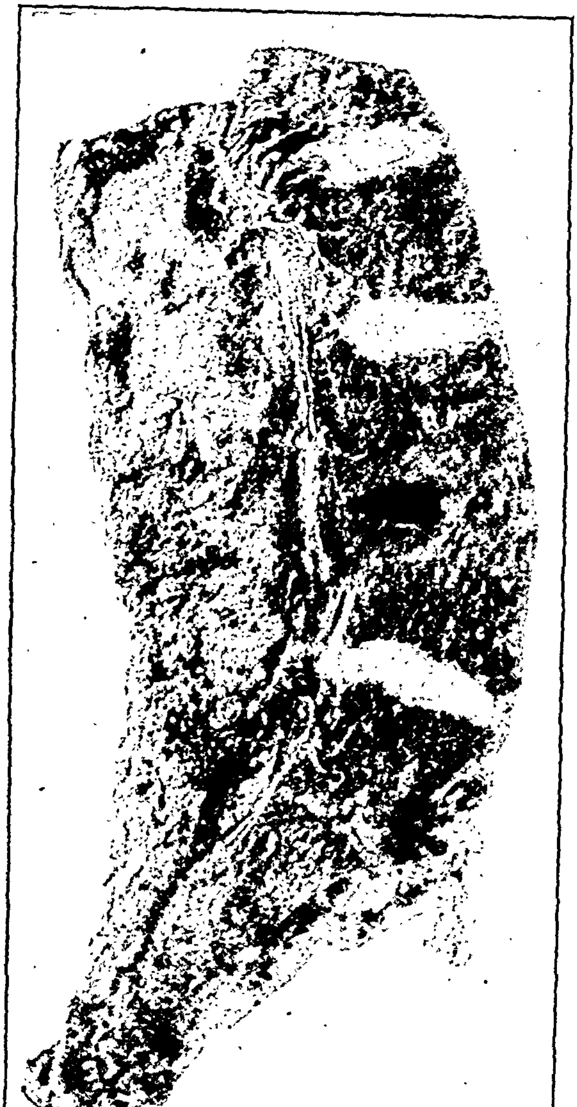
Section in dorsal region. Note the acute inflammation and very extensive exudation all around the cord in Figs. 1, 2, and 3.

6th: Much more pus came from the wound in the back, and along with it a good deal of clearer fluid like cerebrospinal fluid. 7th: The patient was distinctly weaker. The pulse and temperature rose as the evening advanced. Lumbar puncture was again performed, but no fluid came away. 8th: He was much worse. There was some retraction of the abdomen Paralysis of the seventh and third nerves on the left side was noticed, and pus appeared in the conjunctival sac. The optic discs were examined frequently, and with the fleeting glance one got of them no optic neuritis could be made out.

Abstract from the Post-mortem Report.

The body was that of a young man poorly nourished. An ulcer measuring 3 in. by 4 in. was present over the upper part of the sacrum on the left side. Extensive adhesions were present in the abdominal cavity. Adhesions were present at both apices and at the base of the right lung. Brain: The vessels were uniformly congested and the convolutions were flattened. At the base of the brain, in the interpeduncular space and in patches over the inferior surface of the cerebellum and the temporo-sphenoidal lobes there was a thick creamy exudate. This thick yellow exudate also covered the pons, medulla, and the whole of the spinal cord. The exudate was of extraordinary thickness in the lumbar region. (See Figs. 1, 2, and 3.) In the sacral region, on either side of the spinous processes, the muscles were infiltrated with purulent material. The lower portion of the spinal column was removed and an antero-posterior section was made through the bodies of the vertebræ. A small cavity containing purulent material was found in the disc between the fourth and fifth lumbar vertebræ. This cavity communicated with the spinal canal. The bodies of the vertebræ above and below were infiltrated with yellow purulent material. Films made from the exudate in the cerebral and spinal meninges, also from the pus in the cavity in the spine, showed long chains of a capsulated diplococcus. Cultures were made from the exudate and the following organisms were isolated: (1) a Gram-positive streptococcus in comparatively long chains and showing a well-marked capsule; (2) a Gram-positive bacillus; and (3) a yeast.

FIG. 4.



Section through lower lumbar vertebræ and sacrum. Note abscess cavity and sequestrum above it in the body of the vertebræ.

Microscopic section of the brain and spinal cord showed an extensive fibrinous exudate on the surface of the pia arachnoid, in the meshes of which numerous polymorphonuclear leucocytes could be seen. Here and there masses of cocci were visible in suitably stained preparations. Sections of the affected vertebræ showed marked infiltration of the spaces between the bony trabeculæ, with fibrin and polymorphonuclear leucocytes. These showed in places a tendency to degenerate and undergo necrosis. Masses of cocci could be seen. After examining a number of preparations a small focus of undoubted tuberculous nature was found.

The pathological findings indicate that the case was originally one of tuberculosis of the vertebræ, although the disease had not advanced far. A terminal infection with streptococcus mucosus occurred. The appearances indicate that this originated in one of the affected vertebræ or in the intervertebral disc, the source of infection being probably the ulcer on the back. The organism isolated corresponded to that described by Schottmüller, Neumann, and Lingelsheim, and called "streptococcus mucosus." The exudate in the meninges was unusual from its extraordinary thickness.

THE SURGICAL TREATMENT OF STREPTOCOCCIC ARTHRITIS.

By JOHN O'CONOR, M.A., M.D. T.C.D.,
SENIOR MEDICAL OFFICER TO THE BRITISH HOSPITAL, BUENOS AIRES.

SOME seventeen years ago I first invited attention to the utility of surgical intervention in many cases which present all the characteristic clinical symptoms of "rheumatic fever," but which do not respond to treatment by salicylic acid or its derivatives.[1] Five years later I amplified my views on the subject and published a series of cases showing the value of incision with irrigation and drainage of infected joints.[2]

During the past ten years I have performed 214 *arthrotomies*, the *majority being for* recalcitrant cases of acute "rheumatic" arthritis. As it would be superfluous to occupy space with notes of scores of individual cases, I will merely state that the mortality has been *nil*, that there has not been a case of septic infection, that in *not a single instance* has a valvular lesion developed after operation, and that the treatment has afforded uniformly good results. It may be of some interest if I restate the creed on which I based my treatment.

Acute rheumatism is primarily a joint affection, due to some pathogenic germ (streptococcus) conveyed by the blood from an infected tonsil, decayed teeth, or some lesion in the intestinal mucous membrane. The joint invasion is promptly followed by a form of acute arthritis with general toxæmia, and the infected joints serve as incubators, where the poison is elaborated and poured into the circulation and thus conveyed to other articulations and to the cardiac valves. In some cases the joints retain the virus in a latent condition until some chill or other cause rouses it into activity. Holding such views as to causation, it naturally followed that I should suggest that the term acute infective arthritis be substituted for rheumatic fever, &c., and that the names gonorrhœal,[3] pyæmic, tuberculous, syphilitic, &c., be retained in order to differentiate the infection peculiar to each.

I wish once more to draw attention to a *form of infective cellulitis* which not infrequently appears to be the dominant manifestation of the disease about ankle-joints and wrist-joints, sometimes associated with apparent arthritis of these joints and sometimes not. Owing to the almost constant existence of this condition in cases of severe multiple infection, I considered it necessary to employ the comprehensive pathological title[4] "acute infective arthritis and cellulitis." I now think it opportune to conform with recent bacteriological teaching and adopt the simple and definite term streptococcic arthritis.

[2] 150 Arthrotomies, THE LANCET, April [illegible]
[3] Surgical Treatment of Gonorrhœal Arthritis, THE LANCET, Dec. [illegible], [illegible], p. [illegible]

As to treatment,[5] I make it a rule to operate on cases which do not promptly yield to medical treatment (sod. salicyl. ʒss., sod. bicarb. ʒi., three hourly; salines, milk diet, woollen clothing, &c.). All infected joints are opened, flaky turbid lymph is evacuated, free irrigation with warm oxygen water, drainage-tubes inserted and retained *in situ* for three days. Multiple incisions are made into areas of periarticular cellulitis and hot mercurial fomentations applied. Splints are employed for immobilisation purposes for from seven to ten days, at the end of which the patient is requested to commence graduated active moment. When wounds are healed gentle massage is prescribed.

Buenos Aires.

THE TECHNIQUE OF ABDERHALDEN'S SERUM REACTION.

BY W. E. BULLOCK, M.D. EDIN., B.SC. LOND.,
ASSISTANT, IMPERIAL CANCER RESEARCH FUND.

IN November of last year a series of experiments were commenced with the object of determining the value of Abderhalden's serum reaction—dialysis method—in the diagnosis of cancer. The results obtained by following exactly Abderhalden's technique were inconclusive, as the examples given later show. The principles of the reaction have been stated and the chief details of the dialysis method described so often that it is unnecessary here to do more than emphasise certain points in so far as they bear upon the modifications in the method to be suggested in this paper.

Ninhydrin, the reagent used to test for the decomposition products of proteins, reacts with numerous other substances, as was shown by Neuberg.[1] Dextrose is the most important of these substances owing to its presence in blood serum. When 0·2 c.c. of a 1 per cent. solution of ninhydrin is boiled for a minute with a dilute solution of glucose in distilled water a transitory red colour is obtained. If normal saline be substituted for the distilled water the colour obtained is more or less permanent. The same reaction takes place with other sugars—e.g., galactose, maltose, &c. This formation of colour with sugars probably explains the various reddish shades of purple often obtained in testing dialysates in experiments with blood serum. Abderhalden's explanation[2] of these colours is that either the experiment has been carelessly carried out or the blood contained acids or alkalies.

In carrying out a test 0·2 c.c. of ninhydrin solution is added to 10 c.c. of a solution of albumin, peptone, or amino-acids, and the mixture boiled for one minute. In order to secure regular boiling and to prevent "bumping" Abderhalden recommends "boiling sticks" made of wood and specially prepared; the small pieces of unglazed porcelain or broken glass ordinarily used by chemists are equally efficient. An extraordinary stress has been laid on "boiling for exactly one minute." Whilst it is obviously necessary to boil the tubes an equal length of time—and experience has shown that one minute's boiling is sufficient—the importance attached to this rule naturally suggests that a method by which the tubes are heated together would be preferable to that of boiling each tube separately in the Bunsen flame. Such a method has been adopted in the apparatus devised for the purpose by Abderhalden,[3] who nevertheless uses it only for testing tubes in preliminary experiments with dialysing sacs and not for actual serum experiments. A simple and satisfactory method for solutions of leucin is to place the test-tubes containing the dialysates to be tested in boiling water and to remove them again in nine minutes. In order to reduce the amount of evaporation the tubes may be lightly corked after they have been two minutes in the bath.

In comparing the results of the ninhydrin tests it is sometimes difficult to judge small differences of tint when the colours are compared in ordinary test-tubes. This difficulty has been overcome by the use of tubes 23 cm. long by 9 mm. bore, made of colourless glass. The boiling with ninhydrin is carried out in a test-tube, and the liquid is then poured through a small funnel into one of the long narrow tubes. A comparison of colour is made by holding the tubes on a sheet of white paper in a good light and looking directly on the column of liquid. Small differences are easily detected in this way. These tubes are also well adapted for a comparatively rough but very useful method of obtaining an idea of the quantitative differences in colour. 1 c.c. of the liquid with the weakest reaction to ninhydrin is placed in one of the long tubes and distilled water added until only the faintest violet colour is visible when the column of fluid is looked at through the open end of the tube. As a rule—at least when 0·5 c.c. of blood serum is used as the minimum dose in an experiment—it is not necessary to add any water at all. This tube is now the standard colour and volume. A cubic centimetre of liquid is taken from each of the ninhydrin tests and diluted until a standard volume is of a standard colour. The amount of water added is a measure of the depth of colour.

Examples of Results obtained by using Abderhalden's Technique.

1. Sera from rats bearing a tumour (rat tumour 9) and from normal rats were obtained after starving the animals for 18 hours. The sera were clear and free of hæmoglobin and were used immediately.

Serum.	Substrate.	Ninhydrin test.	Biuret test.
1·5 c.c. normal.	1 g. (approximately) rat tumour 9.	+	–
1·5 c.c. tumour.	" "	+	–

2. The experiment was repeated.

Serum.	Substrate.	Ninhydrin test.	Biuret test.
1·5 c.c. tumour.	Rat tumour 9.	++	–

[3] Münchener Medizinische Wochenschrift, No. 5, p. 233, 1914; and Abwehrfermente, fourth edition, p. 232.

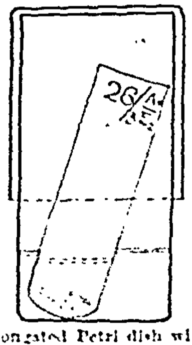
3. Rabbit placenta was prepared as substrate; a pregnant rabbit and a buck were starved for 18 hours and then bled from the ear vein. The sera obtained were clear and free of hæmoglobin.

Serum.	Substrate.	Ninhydrin test.	Sulpho-salicylic acid test.
0·5 c.c from doe.	Rabbit placenta.	–	–
1·0 c.c. ,,	,,	–	–
1·5 c.c. ,,	,,	++	–
2·0 c.c. ,,	,,	(+)	–
0·5 c.c. ,,	Nil.	–	–
1·0 c.c. ,,	,,	(+)	–
1·5 c.c. ,,	,,	+	–
2·0 c.c. ,,	,,	+	–
0·5 c.c. from buck.	Rabbit placenta.	–	–
1·0 c.c. ,,	,,	–	–
1·5 c.c. ,,	,,	++	–
2·0 c.c. ,,	,,	+++	–

There was not sufficient serum from the buck to set up the control of serum alone.

It is obviously impossible to draw any conclusion from such results. The most striking point is the irregularity of the depth of the ninhydrin test of the dialysates. In the last experiment quoted, for example, the dialysate from the test, 2 c.c. of serum from pregnant rabbit plus rabbit placenta, contains less ninhydrin-reacting substances than the dialysate of the preceding test with 1·5 c.c. of serum. Abderhalden's explanation of such results[4] is that the digestion of the substrate has proceeded further (more amino-acids produced) in the test in which 1·5 c.c. of serum was employed than in the other case. The explanation is not satisfactory, however, since the conditions under which the tests were made were similar. The following experiment shows that the dialysing tubes were the source of error. Forty of Schleicher and Schüll's dialysis tubes, No. 579 A, 16 mm. by 50 mm., were well soaked in water and then tested with 2·5 c.c. of a 5 per cent. solution of egg-white. The tubes which permitted egg-white to pass were discarded; the remaining impermeable tubes were well washed with water, sterilised in the autoclave, and then tested with 2·5 c.c. of a 5 per cent. solution of Witte's peptone. The sacs were separated into groups according to the depth of the ninhydrin reaction. In my experience with about 100 of these sacs the largest group of equal permeability out of 40 consists of 5 or 6. The largest group of sacs thus obtained were well washed and sterilised in the autoclave and again tested with peptone; the ninhydrin reactions were strikingly unequal.

This alteration in the permeability with sterilisation renders the sacs practically useless, and it was therefore decided to attempt to prepare dialysing tubes of collodion. At the same time the Erlenmeyer flasks recommended by Abderhalden were replaced by elongated Petri dishes of suitable size. (See Figure.) For the dialysing sacs described below the inner cylinder measures 4 cm. by 8 cm., the outer 4·5 cm. by 5 cm. These cylinders are washed separately, put together, and wrapped in paper, and then sterilised in hot air.



Elongated Petri dish with dialysing sac *in situ*.

Preparation of dialysing sacs.—By numerous experiments with solutions of varying concentrations of pyroxylinum in alcohol and ether of varying proportions it was found that sacs of almost any degree of permeability could be prepared. For the purposes of the Abderhalden reaction the following concentration of collodion is required: gun cotton, 2·6; absolute alcohol, 33 c.c.: and ether, 67 c.c. The gun cotton is dried to constant weight by exposure to air; the alcohol is poured over it, contained in a stoppered bottle. After 24 hours the ether is added, and the clear solution obtained is ready for use.

Schleicher and Schüll's extraction thimbles, No. 603, 22 mm. by 80 mm., are taken and shortened by a centimetre. A number and the number of times the thimble is to be immersed in collodion and the relative proportions of ether and alcohol are written with India ink on each tube, thus, for sac No. 26:— $26/_{3}\frac{A_{1}}{E_{2}}$. By this means a record of the behaviour of each sac is easily kept.

The sacs are now boiled in a mixture of equal parts of alcohol and ether in order to displace and disperse the air from the interstices of the paper. They are then filled and covered with collodion of the composition given above. After the lapse of an hour the tubes are taken out of the collodion, allowed to become almost dry, and then replaced for ten minutes. This is repeated, and the tubes when almost dry are placed in distilled water. By these processes the paper of each thimble becomes impregnated with collodion, and six layers (three inside and three outside) of the same material are formed.

It is important to remember that the concentration of the collodion is rapidly altered by evaporation of ether, and to a less extent of alcohol. The collodion should therefore be freshly prepared and a fair number of sacs (say 16) made at one and the same time. This is easily done if sufficient collodion is prepared to make 25. The thimbles are boiled in the alcohol-ether mixture contained in a saucepan; the fluid is poured off, and the thimbles are then covered with the collodion. The lid of the saucepan is fixed tightly to reduce evaporation.

The freshly made sacs are quite impermeable to solutions of egg-white, and are easily permeable to a 2 per cent. solution of Witte's peptone or to silk-peptone of a much lower concentration. After being used several times—and consequently sterilised several times—the collodion tubes *become more permeable. It is now possible to distinguish between minute amounts of Witte's peptone*, as the following experiment illustrates, and at the same time the sacs are impermeable to albumin.

The delicacy of ninhydrin as a reagent for Witte's peptone is rather better than 1 in 1000—i.e., 0·01 grm. in 10 c.c. To 20 c.c. of water 0·22 grm. of Witte's peptone was added and 2 c.c. of the solution placed in each of half a dozen collodion sacs and the sacs dialysed for 18 hours against 20 c.c. of distilled water; the dialysates give a faint and equal reaction with ninhydrin. 0·26 grm. of Witte's peptone was dissolved in 20 c.c. of water, and in each of six collodion sacs 2 c.c. of the solution was placed and dialysed for 18 hours against 20 c.c. of water. The dialysates were tested with ninhydrin and gave an equal result of a distinctly deeper tint than the dialysates from the first set of tubes. It is thus possible to distinguish between 0·2 grm. and 0·24 grm.

---

[4] Abwehrfermente, English translation, pp. 220-221.

(approximately) each contained in 2 c.c. of water. In other words, the degree of permeability of the collodion sacs to peptone corresponds at least to the delicacy of the ninhydrin reaction with the same substance. And since the substances to be detected in an actual experiment with blood serum are in my experience invariably amino-acids, the delicacy of these sacs is even greater than the experiments above indicate.

When the sacs have been in use for some time (six to eight weeks) and have been sterilised in the autoclave about 20 times they become permeable to albumin, and are then useless for the purposes of serum tests. There is thus a gradual increase in permeability, and it is only during the middle part of the "life" of a sac that the requirements of the Abderhalden reaction are complied with ideally—viz., (*a*) impermeability to serum albumin and globulin; (*b*) easy permeability to Witte's peptone; and (*c*) unalterability with sterilisation. Since, however, in an actual experiment amino-acids are always tested for—peptones in my experience being never found in the dialysate—the early life of a sac is perfectly satisfactory. But it is obvious that in any given experiment the sacs employed should have been made together at the same time, and should have been autoclaved an equal number of times.

The results obtained with such tubes will be published in a subsequent paper, but it may be pointed out here that by the use of graduated doses of serum and by invariably testing the dialysate with sulpho-salicylic acid a constant record of the permeability of the sacs is kept. Since sulpho-salicylic acid detects 1 part of albumin in 40,000 of water, it is clear that any alteration in the behaviour of the sac towards albumin is indicated at the earliest possible moment and before quantities recognisable with ninhydrin can pass. And, further, by the use of graduated doses of serum any alteration in the permeability of the sacs to amino-acids would be indicated by discordancy in the results of the ninhydrin tests.

THE GEOGRAPHICAL DISTRIBUTION OF APPENDICITIS.[1]

BY R. W. MURRAY, F.R.C.S. ENG.,
HONORARY SURGEON, DAVID LEWIS NORTHERN HOSPITAL, LIVERPOOL.

THERE can be no doubt that inflammation of the vermiform appendix is met with far more frequently now than was the case 20 years ago. Not only so, but from my own experience I am convinced that the type of the disease has altered. When treating appendicitis 20 years ago my general practice was to apply fomentations and attend to the bowels. I very seldom had occasion to operate, and when I did it was merely with the view of opening an abscess. The immediate and after results of this treatment were satisfactory. To-day, owing to the more virulent type of the disease, such treatment would surely end in disaster, and in common with most surgeons (I wish I could say all surgeons) I arrange for an operation as soon as the diagnosis has been established. This line of action has been forced upon surgeons owing to the rapidity with which gangrene of the appendix occurs, and the frequency with which concretions are found within its lumen.

The Etiology of Appendicitis.

Why is it that appendicitis has increased in frequency and altered in type? A very natural and interesting question, but by no means an easy one to give a satisfactory answer to. This communication is an endeavour to find an answer, and I have accumulated certain evidence which I believe may help in solving the riddle. However, before adducing my evidence I wish to draw particular attention to a paper which appeared in the *Liverpool Medico-Chirurgical Journal* in 1910. This paper, entitled "The Etiology of Appendicitis," was written by that brilliant young physician, the late Dr. O. T. Williams, and to my mind is by far the most important pronouncement on this subject which has appeared in recent years. In a previous communication Dr. Williams had shown that intestinal sand, appendix concretions, and the large bodies resembling gall-stones sometimes found in the intestines are allied in chemical constitution and formed of fat compounds. In the paper to which I refer he says:—

> This contribution records further observations on the relation of abnormal fat processes to the etiology of appendicitis, and shows that similar changes occur *in the wall of the appendix itself.* ...... Concretions do not occur in all cases of appendicitis, but the following investigation into the nature of the changes taking place in the appendix shows that the process by which they are formed may go on in the wall of the appendix and give rise to morbid conditions which allow of early invasion by micro-organisms, and thus to the acute and chronic forms of appendicitis. These changes are the formation of calcium soaps in the mucosa and submucosa of the appendix. These soaps, normally expelled into the lumen of the appendix and then into the cæcum, in cases of appendicitis block up the lumen of the glands or (as in many of the specimens obtained) form almost a complete ring in the submucosa. ...... The changes cannot be due to involution, as they are seen in specimens obtained from cases occurring in children. ...... The important question consequently arises whether this change is the cause of the disease, or whether there is some underlying cause which produces these changes and the disease. From what we know of the formation of these calcium soaps it is a very slow process, and therefore must have commenced long before the attack of acute disease. It may therefore be presumed that these fat changes go on, produce the altered condition of the mucous membrane, or in some instances form an impermeable barrier in the submucosa, cutting off the nutritive supply to the already altered mucous membrane. The invasion by organisms is thus rendered much easier. ...... Sections of appendices stained by the methods used by Koltz and Lorrain Smith show the colour reactions from which the nature of the chemical changes in the wall has been deduced. The specimens were obtained from appendices removed by operation and placed immediately in formol. ...... The nature of the fats in the food determines to some extent the nature of the fats in the tissues. It would therefore seem that as these abnormal processes are set up by saturated fatty compounds (palmitic and stearic) and not by unsaturated fatty compounds (oleic), the nature of the fat in the diet might have some influence in their production. This is made still more likely when we recognise that the absorbability of these two forms of fat is so different.

In order to ascertain whether an excess of saturated fat (as in beef or mutton) in the diet is more liable to produce the disease than unsaturated fat (as in olive oil) Dr. Williams wrote to His Majesty's representatives in all countries having a population of over 2,000,000, and "the statistics showed an increasing incidence in appendicitis in those countries where much saturated fat is consumed." I have quoted at some length from the paper of Dr. Williams, not merely on account of the interest and importance of his remarks, but also because they lead up to the clinical facts I have gathered together, which are complementary to his views.

---

[1] A paper read before the Liverpool Medical Institution.

Results of Inquiry into its Geographical Distribution.

So far as the geographical distribution of appendicitis is concerned the information obtained by Dr. Williams referred, for the most part, to the inhabitants of large towns. I thought it would be interesting to extend the inquiry, so a few months ago I wrote to medical men practising in more remote parts of the world, asking whether they commonly met with cases of appendicitis, and if it occurred among the natives in that district. One weak point regarding evidence so obtained is that practitioners in these distant regions may not have sufficient clinical knowledge to make their diagnosis of appendicitis sufficiently reliable. In order, as far as possible, to obviate this error I made a careful selection of the men I wrote to, most of whom hold hospital appointments and have been in practice in that district for some years. Although I have already acknowledged their letters, I must take this opportunity of once again thanking these gentlemen for so kindly furnishing me with most interesting and useful information.

I now propose to take you for an appendicular trip round the world. The following are the chief points contained in the letters I have received:—

Nyassaland, Central Africa.

1. I have never seen appendicitis amongst the natives.
2. I asked Dr. Caverhill, of the Blantyre Mission, who has charge of the native hospitals and has been in this country ten years, and he authorises me to state that in 5000 in-patients he has never seen a case of appendicitis in a native.
3. I have met with four cases here in Europeans: two yielded to palliative treatment, two were operated upon.

A. H. BARCLAY.

Fez, Morocco.

Among the natives in Morocco appendicitis is a very rare disease. During my 16 years in the interior I can recall only two cases. I have seen several cases among Europeans, but my work lay chiefly among the natives.

E. S. VERDON.

English Mission Hospital, Jerusalem.

Amongst the Jews here we see appendicitis less frequently than at home. I have only attended 12 cases since 1909. A medical man here of my acquaintance has during the past four years seen only one case of appendicitis among the natives proper. Jewish living is rather more civilised than the native living.

O. H. CORBETT.

The Victoria Hospital, Damascus.

Appendicitis is fairly common in these regions. As you can readily understand, many such cases are overlooked or misunderstood. The medical men in these outlying districts are not always capable of diagnosing them. During the past nine months I have operated upon half-a-dozen cases.

FRANK J. MACKINNON.

I regret that Dr. Mackinnon, who has been resident in Damascus for over 20 years, did not state whether this disease is more commonly met with now than when he first came to the city, and whether it was more prevalent in one nationality than another in this ancient and cosmopolitan city, for Sir Frederick Treves tells us that here are to be seen customs and details of living which appear to the traveller now just as they did four centuries ago when the Caliphs reigned.

In *India* appendicitis is commonly met with in the large cities, but there is a general consensus of opinion among medical men practising in India that this disease does not occur among the natives in the outlying districts.

Membakut, British North Borneo.

In two years' residence on the West Coast of Borneo I only remember seeing one case of appendicitis, and that was in a coolie, an indentured Chinaman. As regards the occurrence of this disease among natives, my experience is of small value because native labour is very little used on estates and I rarely have a native as a patient.

R. S. ROPER.

Chung King, Western China.

In all my 16 years in China—most of it spent in West China—I have only seen one case of appendicitis in a Chinese, so am forced to the conclusion that the disease is very rare and hardly exists in the Chinese.

I beg to offer the following explanation why in my opinion the disease is so rare in the Chinese. Appendicitis is a rare complaint because a Chinaman eats on an average only two meals a day, but takes a good square meal of four or more bowlfuls of beautifully cooked rice and vegetables (meat or fish very seldom), and he sits down and takes a long time over his meal. The chief meat in China is pork, and the average Chinese cannot afford to buy it. The Chinese have beautiful white teeth, so that in addition to the time he takes over his meals he always masticates his food well.

RICHARD WOLFENDALE.

Pakhoi, South China.

I have not seen a single case of appendicitis during the 10 years I have been in China. I think you will find that this applies to the whole of South China.

H. GORDON THOMPSON.

Moukden, Manchuria.

None of us have seen a case of appendicitis amongst the Chinese here. I am wrong—one of us saw one case which, however, was not operated upon. One of the Pekin men told me that cases do occur amongst the Chinese there, so we may hope still!

R. HOWARD MOLE.

Territory of Papua (New Guinea).

I have been in Papua for nearly ten years, living mostly in close contact with the natives, most of the time either as medical officer or resident magistrate, and have been struck by the rarity of appendicitis. While in this country I have seen a very mild attack in a European, one rapidly fatal case in a Samoan, and one typical attack followed by recovery in a native Papuan cook boy of my own. Beyond these three I have never seen a suspicious case, and it is remarkable that the only Papuan case was one where the patient had practically taken to European food and mode of living.

W. M. STRONG,
Acting Chief Medical Officer.

Yarloop, Western Australia.

In answer to your question about appendicitis, I do not often see it here. In our hospital in-patients average 120 a year, and only 2 per cent. are cases of appendicitis. I believe it is very prevalent in the large towns.

S. C. MOORE.

British Solomon Islands.

During the past three years I have never met with a case of appendicitis amongst the natives or heard of one. Among the white population I heard of a man who was taken suddenly ill, shipped off to Sydney, and successfully operated upon for appendicitis.

R. H. S. MARSHALL.

Trinidad, B.W.I.

We have had a good many cases of appendicitis here during the last few years. They have occurred, however, chiefly among those of European birth or descent. Personally I have not met with any cases among the coloured races. The population of this island is about 330,000, and, roughly speaking, the whites would number about 4000.

WILLIAM S. CLEAVER.

Kingston, Jamaica.

I send you a short catalogue of the cases dealt with at the hospital here, from which you will gather that appendicitis is not common. We have formed the opinion that race is not the factor to be considered, as the condition occurs among those who conform to the standard of European life, and is very rare among the natives who live a more or less primitive life.

J. A. ALLWOOD.

With regard to the *Southern States of America* Dr. Howard Kelly, in his work "The Vermiform Appendix," says:—

> The negro race seems to be comparatively exempt from this affection. In order to obtain some information upon this point I wrote to several surgeons practising in Southern cities having a large proportion of negro inhabitants. The replies were unanimous in regard to the rarity of the disease in this race. ...... Dr. L. L. Hill, of Montgomery, Ala. (in the "black belt") with a coloured population of 9000, could collect the histories of only four cases that had occurred among them, and found that the physician who had been consultant for a number of years at Booker Washington's school, where there are about 1400 coloured students, did not remember ever to have seen a case there; at the Alabama Polytechnic Institute, however, 20 miles distant, where there are 400 boys, there has been an annual average of eight cases. At the former school the diet is simple and the same for all, but at the latter the cadets live at different boarding-houses in the town.
>
> There are 800 negro prisoners at one of the Alabama coal mines, and the physician in charge states that appendicitis is unknown among them. The explanation given for the relative exemption of the negro is that their diet is simple, they take a great deal of outdoor exercise, and they are free from digestive disturbances.

In order to learn whether prisoners in this country, living upon a simple diet and taking adequate out-of-door exercise, are subject to attacks of appendicitis, I wrote to the medical officer in charge of Portland Prison. Dr. Watson kindly furnished me with the following particulars:—

> *H.M. Prison, Portland.*
>
> During the past ten years one case of appendicitis is known to have occurred. I do not think a well-marked case of appendicitis could have escaped detection during this period. The average daily population during the year ending 31st March, 1913, was 696.
>
> W. R. K. WATSON, Medical Officer.

Appendicitis in Animals.

From the prisoners in Portland Prison I went one step lower and wrote to Mr. Plimmer, asking whether appendicitis was met with among wild animals during their captivity in the Zoological Gardens. Mr. Plimmer very kindly looked up the records of the post-mortem examinations and wrote me as follows:—

> *Zoological Society of London, Regent's Park.*
>
> I have gone through the books myself, and enclose an accurate statement of appendicitis here. It is only in the higher apes that we can speak strictly of appendicitis, the other cases are inflammations of the end of the cæcum, which is often pointed, and of similar histological structure to the appendix in apes.
>
> H. G. PLIMMER, F.R.S.

(18 cases in 5 years, 1908-1912.)

Appendicitis proper:—Chimpanzee. Agile Gibbon. Horlock Gibbon.

Inflammations of Cæcum or Cæca in Animals not possessing an Appendix:—

Guereza	1	Wallaby	1
Lemur	2	Peccary	1
Suricate	1	Phalanger...	1
Wild cat	1	Marmoset	1
Cavy	1	Hyena	1
Leopard	3	Snow leopard	1

The Influence of Diet and Other Factors.

Reviewing the facts I have collected I think it must be admitted they go a long way to prove that diet is a very important factor, probably *the* important factor, in the etiology of appendicitis. As this disease prevails amongst meat-eating nations it is further probable that the view of the late Dr. Williams is the correct one—namely, that the most important constituents in our food *predisposing* to appendicitis are the saturated fats, such as are contained in beef and mutton. Though it is true that man is an omnivorous animal, still some of us are possibly more allied to the herbivora than to the carnivora, both as regards idiosyncrasy of tissue and of temperament. However that may be, much of the evidence I have adduced, more especially the experience in appendicitis at the Booker Washington school and at the Alabama Institute, clearly indicates that a change from a simple to a more complicated diet is attended with grave dangers. What actual organism leads the attacking force I do not know, but the bacillus coli group are invariably in at the death.

Mr. Plimmer's observations at the London Zoological Gardens strike me as being a most valuable and interesting contribution to my inquiries, though it must be remembered that altogether, apart from the question of diet, these animals have their whole mode of life radically changed. It is impossible to learn whether wild animals living in their natural surroundings ever suffer from appendicitis, still it is reasonable to suppose they do not. However that may be, it is clear that animals in captivity, owing to the artificial conditions under which they live, do suffer and die from this disease. Those of us who have the privilege of living in large civilised communities, owing to the artificial conditions under which we live, are to a very great extent "animals in captivity," and we, too, suffer and die from this disease.

When we remember that modern social requirements demand that our food shall be such as may lead to an accumulation of calcium soaps in the wall of the vermiform appendix, thus seriously interfering with the circulation through its blood-vessels and impairing its glandular excretion, and further that this cæcal appendage is so placed as to have poured into it the most poisonous of the intestinal flora, the wonder is that any of us escape from attacks of appendicitis.

At the same time, there can be no doubt that, apart from the question of diet, other contributory causes have to be considered. We live in an age of luxury, and taking it all round the pace at which we live has increased greatly of recent years, and I believe the increased frequency of appendicitis and of other gastro-intestinal troubles is the consequence, for our intestinal tract is called upon to do work which is not congenial to it, and naturally rebels. Irregular meals, the "quick lunch," and imperfect teeth all play their part, and in spite of the blessings of golf the general want of physical exercise is very noticeable. For the most part we watch others play games. Nowadays a man has to be in so many different places at the same moment that he has not time to walk—he must be driven; and the motor has come to stay.

I believe the reasons I have mentioned account for the increased frequency with which appendicitis is met with, and the increased virulence of the poison is, I believe, due to the fact that our food is adulterated to an extent unheard of in days gone by. This is an age of patent foods, food preservatives, tinned meats, and frozen mutton, and from early infancy we have over-burdened our digestive tract with chemical and bacteriological poisons it is unable to cope with. All these things follow in the wake of civilisation and the geographical distribution of appendicitis can be determined with a fair degree of accuracy. With a map of the world before one, if a red cross is made in localities where appendicitis prevails it will be seen that all the crosses are placed on civilised communities.

It really would appear that our gastro-intestinal arrangements are not at all suitable for twentieth-century requirements, and a vermiform appendix altogether out of date. As it is hopeless to expect the vermiform appendix to disappear in response to its altered environment, the only way to ensure intestinal peace, so far as it is concerned, is either to remove it during infancy, which would be quite wrong, or to alter very materially our habits of life, which would be quite right. Otherwise this worm-like remnant of a greater cæcum, destined to continue as a companion of the human race, will surely make its presence felt more frequently in the future than it has done in the past. It may even do so in that far, far distant future, "when some traveller from New Zealand shall, in the midst of a vast solitude, take his stand on a broken arch of London Bridge to sketch the ruins of St. Paul's."

Clinical Notes:

MEDICAL, SURGICAL, OBSTETRICAL, AND THERAPEUTICAL.

THE CAUSATION OF STRICTURE FOLLOWING SUPRAPUBIC PROSTATECTOMY.

BY H. W. MILLS, M.R.C.S. ENG., L.R.C.P. LOND.

IT has been stated[1] by one of the greatest authorities on the subject that post-operative stricture does not occur after complete suprapubic prostatectomy, or, to be more technically exact, after subtotal suprapubic prostatectomy, for it is now universally recognised that the surgical capsule of the prostate itself consists of prostatic tissue.[2] Such a statement, although doubtless generally speaking correct, is too sweeping; there are exceptions, and these notes have been written to draw attention to the most frequent cause of such exceptions.

It is a well-known fact, a recognised surgical axiom, that if the mucous membrane be removed from any of the circular orifices of the body occlusion results, and this fact has been taken advantage of to base thereon, for example, Ochsner's operation for radical cure of femoral hernia. Now occasionally—rarely, it is admitted, but still occasionally—on sweeping the finger across the apex of the prostate in the final stage of its enucleation, the mucous membrane of the urethra carries away from a half to three-quarters of an inch anterior to the said apex, with the result that a portion of the membranous urethra is denuded of mucous membrane; unless this is noticed and special measures adopted to prevent such unfortunate results, occlusion of the urethra obtains, and the mucous membrane of the bladder heals completely and smoothly over the original site of the internal meatus.

CASE 1.—The patient was a man aged 67. Operation was performed on Sept. 17th, 1911; it was easy, enucleation lasting four minutes; practically no bleeding; two calculi, one very rough and tuberculated, about the size of marbles; bladder clean; skin wound healed by first intention; about an inch of mucous membrane came away anterior to the apex of the prostate. Sept. 29th: No urine passed per urethram; digital examination of interior of bladder revealed the fact that internal meatus was closed; No. 27 steel sound forced through on to finger; immediately thereafter urine was passed per urethram, and through and through irrigation was possible; sounds were passed daily thereafter, which caused some pain and bleeding for several days; subsequently Kollman's four-bladed prostatic dilator was used regularly, screwed up to 40, and ultimately complete recovery without any stricture occurred. The cure has been permanent.

CASE 2.—The patient, a man aged 73, was sent to me for operation. He had led a catheter life for many years—15 he stated; he denied any venereal history, but admitted alcoholic excesses for 30 years; he had a copious foul purulent urethral discharge, and a tight phimosis, the prepuce being greatly swollen and indurated—so much so as to suggest malignancy; he declined preparatory treatment, and insisted on immediate operation; this was accordingly performed on July 16th, 1910. The operation was simple and rapid, but about half an inch of mucous membrane carried away anterior to the apex of the prostate; recovery, except for threatened delirium tremens, was rapid. I was compelled to leave town two days after the operation and did not return until July 28th, on which day, finding that no urine had passed per urethram, and that through and through irrigation was impossible, as also was the passage of No. 27 steel sound, I made a digital examination of the interior of the bladder, and found that the mucous membrane had healed smoothly over the base of the bladder, and that no opening existed there. A sound was forced through on to the finger, and the opening kept patent daily with the Kollman dilator screwed up to 40. Circumcision had been done at the time of the prostatectomy, but the discharge still obtaining a microscopic examination of the latter was made which revealed gonococci. The explanation which followed revealed the fact that irregular coitus had obtained for two weeks before he came in to see me. This old man had been unfortunate enough to contract his first and only attack of gonorrhœa at the age of 73. An obstinate stricture resulted, requiring constant treatment for many months.

The treatment, of course, is to keep the parts well dilated, until such time as the raw surface is completely covered with mucous membrane, and for a considerable period thereafter insist on the periodical passage of large-size metal sounds; ultimately all is well, for the pathology of stricture, other than traumatic, presupposes the gradual cicatricial contraction of a ring of previously chronically inflamed extra-urethral connective tissue, which in these cases does not obtain.

Case 1 is now quite well with no stricture at all. Case 2 has a modified stricture, though not enough to trouble him; but here the Neisserian infection introduced the factor which is the usual pathological precursor to stricture, so that the present condition must not altogether be laid at the door of the accident, for the purpose of drawing attention to which these notes were written. 2·29 per cent. represents in my personal practice the frequency of this occurrence. I have also observed one instance of stricture in a case in which the urethra was so tough that I could not tear it through with my finger but was compelled to cut it with scissors; the prostate was of the hard scirrhous type.

---

San Bernardino, California, U.S.A.

THE USE OF LIQUID PARAFFIN IN ENTERIC FEVER WITH CONSTIPATION.

BY LLEWELLYN P. PHILLIPS, M.A., M.D.CANTAB., F.R.C.P.LOND., F.R.C.S.ENG.,
PROFESSOR OF MEDICINE IN THE EGYPTIAN GOVERNMENT MEDICAL SCHOOL; AND SENIOR PHYSICIAN TO KASR-EL-AINI HOSPITAL, CAIRO.

IN Egypt it is the exception to see cases of typhoid fever with diarrhœa. Constipation is the rule, and this constipation is often very difficult to manage. I used to treat it by daily enemata, preceded if necessary by a preliminary injection of olive oil; in most cases this was successful, but occasionally the result was not satisfactory. (The enemata are given out of a douche can.) During convalescence I used to commence treating constipation by using cascara and maltine as an aperient. On one occasion during an attack of typhoid fever with mania I had to give olive oil and castor oil in equal parts by mouth and the patient did well. I prefer, however, to leave such aperients alone during the acute stage.

In 1912 one of my patients was so constipated during the beginning of her convalescence that I resolved to use paraffin, and I did so with excellent effect; after that I commenced to use it throughout the illness, and such now is my routine. I have found that in cases in which during former acute illnesses enemata have acted with the greatest difficulty, paraffin, if an enema is necessary, acts easily and painlessly, and both my patients and the nurses have been more than satisfied with the result. It seems absolutely free from risk and, further, it probably acts as an emollient dressing to the typhoid ulcers. The only disadvantage I have seen from its use during typhoid fever has been a little occasional leakage per anum.

I give the drug in a dose of half an ounce at night and, if this be not sufficient, in a dose of half an ounce in the morning as well; it is best taken floated on the top of a little soda-water. With such dosage enemata are often unnecessary, though I still often order the bowel to be washed out so as to remove as much toxic material as possible.

Cairo.

SOCIETY FOR RELIEF OF WIDOWS AND ORPHANS OF MEDICAL MEN.—A quarterly court of the directors of this society was held on July 8th. Dr. Rigden, senior vice-president, being in the chair. Nine gentlemen were elected members of the society. The sum of £1890 was voted for the payment of the half-yearly grants to the widows and orphans. At the present time there are 45 widows and 13 orphans in receipt of grants. The invested funds of the society now amount to £139,500. Membership is open to any registered medical practitioner, who at the time of his election is resident within a 20-mile radius of Charing Cross. The annual subscription is 2 guineas. Special terms for life membership, which vary with the age of the member. Relief is only granted to the widows and orphans of deceased members. Since the last court five letters had been received from widows of medical men asking for relief, but this had to be refused as their husbands had not been members of the society. Further particulars and application forms for membership may be obtained from the secretary at the offices of the society, 11, Chandos-street, Cavendish-square, W.

Reviews and Notices of Books.

Tropical Diseases: A Manual of the Diseases of Warm Climates.

By Sir PATRICK MANSON, G.C.M.G., M.D., LL.D. Fifth edition. With 12 coloured and 4 black and white plates, and 239 figures in the text. London: Cassell and Co. 1914. Pp. 937. Price 12*s*. 6*d*. net.

SINCE the publication of the first edition of this manual by Sir Patrick Manson in 1898 it has held a foremost place among the text-books of tropical medicine. Although in the course of time the dimensions of the work have had to be increased to keep pace with the numerous discoveries and advances in our knowledge of the diseases of warm climates, it still retains to a large extent its original characters and its claim to give adequate information on the subject in a concise and handy form, so that the volume can be carried about by the practitioner in the tropics for consultation on his long journeys or on his tours of duty. Since the previous edition (the fourth) was issued in 1907 the etiology and pathology of a number of tropical diseases have undergone rapid development, such, for example, as kala-azar, trypanosomiasis, spirochætosis, and beri-beri, so that there was urgent need for the publication of the fifth edition of this book. The author, affectionately known to his former pupils and others as "the father of tropical medicine," has now left the fighting ranks of the profession, but has continued in his retirement to keep well in touch with the progress that is going on respecting the diagnosis, treatment, and prevention of the diseases of warm climates. The text in the fifth edition has been enlarged, extended, or revised throughout, while new plates and other illustrations have been added, but the general plan of the book remains the same. The author acknowledges his indebtedness to Dr. Philip Bahr for invaluable assistance in the preparation of this new edition, for rewriting the appendix on protozoa so as to bring it into conformity with the generally accepted teaching of the subject in this country, and lastly, for revising the nomenclature of the many parasites which form so important a feature of tropical pathology.

After an introduction which is concerned with the etiology of tropical diseases, the volume is divided into seven sections, dealing respectively with fevers, general diseases of undetermined nature, abdominal diseases, infective granulomatous diseases, animal parasites and associated diseases, skin diseases, and lastly, local diseases of uncertain nature. In the appendix are described some of the commoner parasitic protozoa of vertebrates and invertebrates, the classification adopted being for the most part that followed by Professor E. A. Minchin in his "Introduction to the Protozoa." The important section on fevers occupies nearly half of the whole book and comprises 24 chapters, nine of which are devoted to malaria in its various aspects. Some persons may question, perhaps, whether pellagra and heat-stroke should be classed among fevers, and whether pellagra at least should not be relegated to the section on general diseases of undetermined nature until its etiology has been worked out. The author himself says that the duration of pellagra is variable and that it may last from two to 15 years or more; in these circumstances it might be urged that this malady can scarcely be regarded as a "fever" in the usual sense. In discussing the incidence of plague in England in recent years Sir Patrick Manson refers to the occurrence of some cases in 1910 accompanied by an epizootic among rodents in "Norfolk." He evidently intends to refer to the group of instances reported in the south-east of Suffolk in that year. In describing the mechanism of the transmission of plague by fleas reference is made to the "recent observations made by Dr. C. J. Martin," no mention being made of his collaborator Mr. A. W. Bacot, entomologist to the Lister Institute, who was responsible for a large share of the experimental work, the official report to the Plague Advisory Committee being entitled, "Observations on the Mechanism of the Transmission of Plague by Fleas, by A. W. Bacot and C. J. Martin." The claims of Dr. H. Seidelin to have discovered the specific parasite of yellow fever are rather curtly dismissed as not being supported by convincing experimental evidence. In the chapter on trypanosomiasis the statement is made that Professor M. Taute, the German sleeping sickness expert in East Africa, *infected* himself with 2 c.c. of blood from a trypanosome-infected dog, the trypanosomes being of the Rhodesian type, but there was no bad effect. We had been led to understand that Professor Taute's experiments on himself failed entirely, so it is perhaps incorrect to say that he "infected" himself. Perhaps "infected" himself should read "injected" himself.

There can be no question that this manual deserves the confidence of every student of tropical medicine and of every medical man practising his profession in the tropics. The advice given as to diagnosis and treatment has been carefully weighed beforehand, the great knowledge and ripe experience of Sir Patrick Manson enabling him to speak with undoubted authority on most of the diseases of warm climates. It gives us great pleasure to recommend this handy volume to the notice of all medical men and students interested in the subject of tropical medicine.

Principles of Surgery.

By W. A. BRYAN, A.M., M.D., Professor of Surgery and Clinical Surgery at Vanderbilt University, Nashville, Tennessee. With original illustrations. London and Philadelphia: W. B. Saunders Company. 1913. Pp. 677. Price 18*s.* net.

IN this work the author has put, in a concise and understandable form, the principles on which the practice of surgery is built. The book treats of surgical bacteriology, of the various infections, of wounds, and of hæmorrhage. It describes the general principles of fractures and dislocations and the various forms of tumours, but it does not enter into the questions connected with special fractures or the occurrence of new growths in any particular organs. This will serve to show the scope of the book, and we may say that it is evidently the work of one who has had much experience in teaching, and we can recommend it to students.

While we appreciate the excellencies of the book, there are some passages to which we must take exception. For instance, we find it stated that "the fact that the hair rapidly comes out in patches (alopecia areata) is very suspicious of syphilis," and "alopecia of the eyebrows is considered by high authority to be pathognomonic of syphilis." It is true that occasionally the loss of hair in syphilis may tend to be patchy, but it is certain that alopecia areata has absolutely nothing to do with syphilis. Alopecia of the eyebrows, also, is far more commonly seen in non-syphilitic cases than in those suffering from syphilis. Again, the author sometimes employs terms which are rarely used and therefore unknown to the average student; thus we find it stated that "enchondromata form in connexion with normal cartilage, especially in the larynx, the ribs of old people, and at the clivus Blumanbachii." We venture to say that 99 students out of 100 would not know what or where the clivus Blumanbachii is.

There are numerous illustrations, some of which are very good, but many show almost nothing, this being in part due to the use of half-tone plates. It is too often imagined that a photograph must show well the condition present, but many details are quite lost in a photograph and others disappear in the process of reproduction for printing. We may instance Fig. 23, which is described as an infected hand, but really it illustrates nothing. In Fig. 198, described as "a metastasis of carcinoma in axillary lymphnode," nothing characteristic is clearly to be seen, and we doubt if a student could learn anything from it. It would be far better if these photographs were redrawn for the purpose of reproduction.

Immunity: Methods of Diagnosis and Therapy and their Practical Application.

By Dr. JULIUS CITRON, Assistant at the University Clinic of Berlin, II. Medical Division. Translated from the German and edited by A. L. GARBAT, M.D., Assistant Pathologist and Adjunct Visiting Physician, German Hospital, New York. Second edition, revised and enlarged. London: J. and A. Churchill. 1914. Pp. 267. Price 14*s.* net.

JUST two years have elapsed since we reviewed the first edition of this American translation of Dr. Citron's work, and we are glad to see the appearance of a second with considerable additions to the subject matter. While the general scope of the work is not altered, chapters have been added on chemotherapy, on anaphylaxis, and on the serological reactions which have been described in relation with tumour formation. The first two chapters deal with the theory of immunity and with laboratory equipment. After these come two devoted to active immunisation, with a special account of aggressins; two on the use of tuberculin in diagnosis and treatment; and two on the relations of toxin and antitoxin. A few pages are devoted to the toxins derived from higher plants and from animals, such as snakes, toads, and so forth, and to ferments present in the blood. Then follow chapters on agglutination, precipitation, and bacteriolysis and hæmolysis. Complement fixation claims two chapters, while one each is devoted to phagocytosis, tumours, anaphylaxis, passive immunity, and chemotherapy. There is an adequate index of subjects and a second of the names of authors quoted, but as the references to the latter are not given the second index is not particularly useful.

The book is the work of an expert, and deals both with theory and with laboratory technique. It will not assist the practising physician in treatment of disease, but is rather designed to initiate the student and practitioner into the theories underlying the various laboratory tests to which so much importance is now assigned. For this purpose we can very highly recommend it. The translation has been considerably improved since we had occasion to point out certain peculiarities of diction in the first edition. We suggest, however, that the two first letters of the word "aërobiosis" do not form a diphthong, and can therefore not be replaced by a single e ("erobiosis"), even on American principles.

A Text-book of Medical Entomology.

By Captain W. S. PATTON, I.M.S., and Captain F. W. CRAGG, I.M.S. Madras: The Christian Literature Society. 1914. Pp. 764. Price £1 1*s.*, or Rs.15.12.

THE title of this book is somewhat of a misnomer, as the authors themselves admit in the preface, for they describe it—and rightly—as "a guide to the study of the relations between arthropods and disease, rather than a text-book of entomology." The actual entomology consists only of the orders Rhynchota, Diptera, Siphonaptera, and Anoplura, because these subdivisions of the insect family alone are concerned with the propagation of disease; but the contents of the volume are increased by a consideration of the mites, ticks, and linguatulidæ, all of which arthropod groups are concerned with the transmission of various "fevers," and the crustacean cyclops belongs to the category by virtue of the fact that it harbours the larva of the guinea-worm, filaria or dracunculus medinensis.

The book is intended, as the first words of the preface denote, for medical and veterinary officers in the tropics; and for their sakes it is constructed as a treatise. In out-of-the-way places in Asia and Africa it is hardly necessary to state that the literature of this subject is not as a rule accessible. Hence the voluminous character of Captain Patton and Captain Cragg's work. All that is wanted must come under two covers for the great majority of those who are occupied with this department of medicine and biology and who find themselves away from civilisation. We do not think that the mode of treatment of the various groups of animals under review in this work is too lengthy, even though the result is somewhat cumbersome. To include after each section a list of the more important publications in journals and elsewhere argues, of course, the hope on the part of the authors that their handbook will prove as useful to those surrounded by libraries as to those scattered in desert places of the earth. And in so far as there does not appear to be any similar condensation of special knowledge this hope can be encouraged. But it is mainly addressed to men who will commence the study of the subject in the "field" with a groundwork of acquaintance with the more general facts of entomology derived from lectures and laboratory work at home. The book is not at all intended to embody an introduction to zoology in general and the history of the arthropods in particular. But given this quite elementary knowledge, the way into the further intricacies of the matter is well lighted up by our authors. Nor do they, as will sometimes happen, betray any favouritism for one or more groups, awarding other groups what the Germans term a "stepmotherly" treatment. Rigid impartiality reigns throughout. The reader will learn just as much of the Rhynchota as of the Siphonaptera. The illustrations, too, are as copious in one case as in another. The actual form of the illustrations is distasteful to us, consisting as it does of so much outline figure on plates, which is better rendered in the form of cuts. But the accuracy and intelligibility are to be praised.

In examining the work we have read with special attention the sections dealing with the two groups of insects just mentioned, which are important with us at home as well as in the tropics. With regard to the fleas (Siphonaptera) we note that the authors advise that all specimens should be sent to the Hon. Charles Rothschild, who is so well known for his careful study of these insects and for his large collections of the same. Here, as in the case of other groups, a very considerable list of memoirs, some of them from Mr. Rothschild's pen, is to be found at the end of Chapter V., which is concerned with these degraded diptera, as some zoologists think them. *The* flea, Pulex irritans, is singularly enough the only species of the genus Pulex to which, according to general opinion perhaps, all fleas belong. It is not confined to man; and, *per contra*, the cat and the dog flea occasionally occur on man. This both confirms and destroys current semi-scientific opinion on the matter. The multitude of species of flea is usually pointed out in works on the subject, but the impression sometimes left is that each of them is rigidly confined to its own pet host. Pulex, think our authors, is originally an Old World genus, but it has accompanied man on his travels, and is now, like man and very few other creatures, world-wide in range. Another very pestilent flea, the "jigger," is, on the other hand, a native of the New World, but has extended its range to Africa and the East. The rat is oppressed with no less than five species of flea—a fact of importance for the medical biologist in view of the transference of the plague by rats. The actual carrier of the germ has to be recognised among its fellow fleas.

We wish that we could commend the publishers' share in this volume as heartily as we do that of the authors. But it is not to be disguised that the appearance of the book is most unattractive and unwholesomely swollen. The two authors, we need scarcely point out, are already favourably known for their investigations into the structure of disease-carrying insects, and we have had many occasions lately of noticing their work in these columns.

A Text-book of General Embryology.

By WILLIAM E. KELLICOTT, Professor of Biology in Goucher College. London: Constable and Co., Limited. New York: Henry Holt and Co. 1914. Pp. 376 Price 10*s.* 6*d.* net.

ENTERTAINING the view that general embryology should occupy an important place in the collegiate study of biology, the author has published this book, which is the direct outgrowth of his own experience as a teacher of the subject, and its substance has, in fact, been in use as a text for several years. The facts of embryology lead directly to the great problems of the science of biology, and therefore the topics considered have been approached from the standpoint of their general biological relations. For those desiring a more elementary and brief course the parts in large type suffice. The small type also will be used by those pursuing a more elaborate course. The illustrations are particularly good, clear, and well selected. Most of them have been redrawn from the original sources. At the end of each chapter is a list of references to literature. We indicate the space occupied by the important sections to show the symmetrical planning of the work.

Ontogeny is first dealt with in about 30 pages. Embryology is defined as the science of the genesis of the adult organism. The various processes of reproduction are described and illustrated by numerous figures in the text, and the fundamental character of the relation of embryology to the cell theory is emphasised. The author attempts to explain "how it all happens"—i.e., the transformations of substance, energy, and form. The Cell and Cell Division occupy about 50 pages, the cell in structure and action being the basis of modern embryology. More especially is the importance of polarity in germ cells dwelt on. The description of mitosis as it occurs in various classes of animals is particularly lucid and well worthy of perusal and study, for the mitotic figure is a mechanism effecting the equal distribution to the daughter cells of chromosomal division within the nucleus of the parent cell, so that each new cell has a complete group of chromosomes similar to those of the parent cell. Germ Cells and their Formation are the next subject, and are dealt with in over 40 pages. Lode computed that the total number of sperm formed in man may average about 340 billions, or approximately 850,000,000 sperm for each one of the 400 ova matured during the reproductive period of the female. On the other hand, the codfish is said to form 8,000,000 to 10,000,000 ova and a single species of sea urchin 20,000,000 ova in one season. The number of eggs is smallest where they develop within a brood cavity or where some parental care is exercised. Maturation is next discussed (30 pages) and then Fertilisation (54 pages). When fertilisation is internal the spermatozoa may remain alive and able to function for a very long time—e.g., in bats and snakes from autumn to the following spring, in snails for three years, and in bees for four or five years. Once within the ovum a "foreign" sperm seems to act almost as efficiently as the proper sperm in inaugurating development. The action of the spermatozoon is not specific. Human spermatozoa swim at the rate of 27 mm.—i.e., about 550 times their own length—in 7·5 minutes. At the corresponding rate of progression a man would walk a mile in 12·4 minutes. "Cleavage" (40 pages) is the second of the "grand periods" in individual history. In nearly all species the earliest cleavage planes are definitely related to the polar axis of the ovum. Differentiation, Heredity, and Sex Determination require about 60 pages, and form one of the author's most suggestive chapters, and he comes to the conclusion "that the chromosomes are to-day the determining factors in development and heredity." The final chapter (36 pages) deals with the Blastula, Gastrula, and Germ Layers.

Altogether the work is both lucid and suggestive, while it ranges over the whole sphere of general embryology in a manner which makes the study of so recondite a subject fascinating and attractive.

The Treatment of Diseases of the Digestive System.

By ROBERT SAUNDBY, M.D. Edin. Second edition. London: C. Griffin and Co. 1914. Pp. 179. Price 4*s.* net.

THE first edition of this excellent work, reviewed in THE LANCET of May 18th, 1907, was intended as a guide to the principles and practice of the treatment of diseases of the digestive organs, based on the author's personal experience. The second edition follows the same lines as the first; it has been brought up to date, revised, and enlarged by [illegible] an appendix on dietetics.

Its first 50 pages consist of a general introduction to the subject, the methods of examining the patients, and general considerations about foods, drinks, and diets. Then follow five sections on diseases of the œsophagus, stomach, intestines, and rectum, and on the symptomatic disorders dependent upon gastro-intestinal troubles. In addition to the appendix already mentioned there is at the end of the book a brief list of prescriptions.

This thoroughly practical little volume may be warmly commended to the attention of all medical practitioners. It is written in a concise and straightforward style, and is clearly the fruit of a mature and extensive experience. Dr. Saundby shows great skill in his avoidance of the fads and far-fetched fancies, the *outré* diets and ultra-scientific treatments, that are sometimes imposed upon the well-to-do dyspeptic patient.

Diseases of the Rectum and Pelvic Colon.

By MARTIN L. BODKIN, M.D. New York, Rectal Surgeon, St. Mary's Hospital. Illustrations specially drawn by FRANCIS A. DECK. New York: E. B. Treat and Co. 1913. Pp. 416.

THIS is a convenient guide to the diseases of the rectum in a form likely to prove useful to the general practitioner who looks for assistance in the treatment of a rectal case. It begins with a chapter on the anatomy and physiology of the rectum and of the pelvic colon. An account of the methods of examining a patient follows, and then come chapters on diagnosis and on the symptoms usually associated with disease of the rectum. The various affections of the rectum are described in turn, special stress being laid on those rectal affections that are suited for treatment by medical men in general practice. The treatment of the more serious diseases, such as cancer, is described, but not so fully.

On the whole, we may express a very favourable opinion of this little book. It is clearly written and illustrated by plates which show what they are intended to show. It is only natural that the author should approve of those operations which he himself employs, but the terms in which he condemns the crushing operation for hæmorrhoids suggest that this is a method which he can hardly have personally used. He says "the operation is only applicable to cases one would select as favourable for the injection method." The method can be used with perfect success in any case of hæmorrhoids, as those know who employ it. The author appears to prefer the clamp and cautery operation, which is also an excellent method.

Sanitation in India.

By J. A. TURNER, M.D., D.P.H., Executive Health Officer, Bombay Municipality. With contributions by B. K. GOLDSMITH, M.B., D.P.H.; S. C. HORMUSJI, M.D., D.P.H.; K. B. SHROFF, L.M. & S., D.P.H., D.T.M.; and L. GODINHO, M.D., D.P.H. Bombay: Times of India Press. 1914. Pp. 1014.

IN this volume, dedicated to the municipal corporation of the City of Bombay, is contained the matter of the courses of lectures and demonstrations given to the students of the sanitary surveyors' class by the public health officers of the city, elaborated so as to form a handy and practical guide to sanitation in India. The first chapter deals with the administration of the Public Health Acts, which are based on the English Public Health Act of 1875, and are carried out by the executive officer (who may be [illegible] municipal commissioner, chief municipal officer, or collector), taking the place of the sanitary authority in England. The public health administration of Bombay City is naturally taken as an example of the application of modern sanitary methods in India, and their practical working is described in detail, with a summary of the by-laws now in force, including also the sanitary administration of the port. This section will be of great value to all concerned with the sanitary supervision of a large city or port in a tropical climate in any part of the world.

The collection, removal, and disposal of town refuse are next dealt with; in addition to describing the procedure in London, the details of practice in Bombay, Calcutta, and Madras are furnished. The subject which follows—the collection, removal, and disposal of sewage—is of the greatest importance in a tropical city, and also one of the greatest difficulty. The system at work in Bombay is described in detail and with illustrations; there is also some account of the various dry methods of disposal in use in the country districts and cantonments, though not so fully detailed a description as might have been given. The Shone and Liernur methods of pneumatic removal are mentioned, but not fully described, though the installation of the former system at Rangoon is, we believe, the most complete and extensive in the world. Water and its supply is considered in the fourth chapter. It may be doubted whether the bacteriological details given would be of use to the readers for whom this manual has been compiled; and the arrangement of this chapter cannot be said to be satisfactory. In the next section, on food and milk, we find a description of the parasites in water, which would surely be better placed in Chapter IV. The chapter on infectious diseases and their prevention contains much valuable material, though the information is not always given in an assimilable form, and it is odd to find Bristowe referred to (p. 524) as "a recent writer," under the heading of typhus fever. J. S. Bristowe's treatise on medicine was published in 1876. On the other hand, in a book published in 1914, referring to Indian public health, we think something more should have been said about the causation of beri-beri than that "several theories have been put forward, the most favoured being that of uncured rice; possibly some micro-organism in certain forms of food producing a toxin." There is a full description of plague and the procedure necessary for its prevention; and the chapter on malaria is very complete and well illustrated.

There is a great deal of information in this volume, but the method of presentation does not always do justice to the subjects. It would have been more useful if it had been provided with an index.

LIBRARY TABLE.

The Fundamental Basis of Nutrition. By GRAHAM LUSK, Professor of Physiology, Cornell University. London: Humphrey Milford, Yale University Press. 1914. Pp. 62. Price 2*s.* 6*d.* net.—Patients and laymen often ask for simple books on the theory of diet, and to such inquirers this brochure can be entirely recommended. The position and reputation of Professor Lusk are sufficient guarantee of the scientific accuracy and value of the matter presented, though the presentation is so simple that everyone can follow it. After a short historical survey the reader is introduced to the theory of calories, and proper stress is laid upon the necessity for comprehending the measurement of heat production as a standard of the value of foods. Persons who cannot realise the importance of a knowledge of calories "must be reasoned with and persuaded to listen." They cannot do better than begin with these lectures. From the question of the need of "fuel," heat-producing foods, the author passes to the comparison of various forms of proteins, showing the unquestionable superiority of the proteins of meat, fish, eggs, and milk over those of wheat, beans, or maize; the proteins of rice and potatoes hold an intermediate position. We have given here an excellent account of the varied proteins of the commoner cereals—wheat glutinin, gliadin (the alcohol-soluble protein of wheat), edestin of hemp, and other bodies—which have been laboriously prepared by Osborne and Mendel in the United States. After a brief glance at the habits of different populations in the matter of diet, the writer passes to the important subject of vitamines, upon which much work has probably yet to be done. The initial researches into their nature arose from inquiries into the causation of beri-beri, and are excellently sketched here. The closing chapter is a very practical review of the monetary value of foods, in which a proper tribute is made to the valuable contribution to this subject afforded by Miss Dorothy Lindsay, under the direction of Dr. Noel Paton. A very wide investigation has recently been made by Dr. F. C. Gephart, of the Russell Sage Institute, who obtained his material from the ordinary meals of the "Child's Restaurants," establishments well known throughout America for the high quality of their food material and the moderate scale of their charges.

The Purpose of Education: An Examination of the Education Problem in the Light of Recent Psychological Research. By ST. GEORGE LANE FOX PITT. Cambridge: University Press. 1913. Pp. 83. Price 2*s.* 6*d.* net.—The author has written a little book on the application of certain findings of experimental psychology to the elucidation of educational problems in the hope of clearing up some prevailing confusions and difficulties. He believes that we err either on the side of making exaggerated claims for the importance of the "inner life," or on the side of assigning too much to the effect of "environment." In the pursuance of a middle path lies our best hope for the future of the race. As far as the former is concerned, the author holds that the strength and worth of our personality are determined by the quality, nobility, and coördination of the "complexes" of which it is composed. Complexes are ever in a state of flux, ever changing and developing, adapting themselves to, or assimilating themselves with, their environment. Hence the right way to awaken or develop character is by the harmonious interaction of varying complexes with chosen or accidental environments. An individual's likes and dislikes, tastes and preferences, can be cultivated, repressed, or developed, and in the subordination of the lower to the higher lies the true goal of systematic education. It is a fallacy to imagine that mental disposition and environment are mutually independent; to attain the ideal state of perfect interaction instincts must be rationalised, not ignored. To use a Freudian expression, they must be sublimated, not denied. The book commends itself to the thoughtful reader and to the teacher who wishes to be more cognisant of the psychical processes involved in the art of pedagogy.

Diabetes: Its Nature and Treatment. What Diabetics Ought to Know. By the Hon. Dr. T. M. NAIR, M.D. Madras: Higginbothams, Limited. 1914. Pp. 147. Price 6*s.* 6*d.* net.—The author, an Indian, and an M.D. of Edinburgh, in the preface expresses the hope that his small book "will be of some little use in enabling the public to understand what has already been established, and to estimate what there is yet to be disclosed." On glancing it through to appraise its fitness as an enlightener of the public in those things that a patient ought to know, the first thing that struck us was two or three pages of graphic chemical formulæ illustrative of the difference between normal katabolism and its perversion in the production of acetone. The natural inference was that this was a specimen of the quasi-learned book making an *ad captandum* appeal to the public. Extended perusal, however, showed it to be really a conscientious and careful summary of present knowledge and theories in regard to diabetes in almost all its relations. A book whose author closes by describing it as a "short account of a disease whose etiology we do not know and for which we have no effective treatment" seems hardly ascribable to unprofessional motives. The frequency of diabetes in India gives point to the statement in the introduction that "an organised research into the etiology and pathology of diabetes ought to be conducted in India very much like cancer research or the campaign against tuberculosis in England." The book is written in excellent English and shows a discriminating study of a wide field of modern medical literature. We should prefer to describe it as indicating much that the diabetic's medical attendant, rather than himself, ought to know.

Nouveau Traité de Chirurgie. Publié sous la direction de A. LE DENTU et PIERRE DELBET. *Maladies de la Mamelle.* Par AMÉDÉE BAUMGARTNER, Chirurgien des Hôpitaux de Paris. Avec 56 figures dans le texte. Paris: J. B. Baillière et Fils. Pp. 339. Price, paper, 6 francs; boards, 7.50 francs. —In this volume of Le Dentu and Delbet's elaborate treatise on surgery Dr. Baumgartner has succeeded in putting into a comparatively small volume all the essential facts connected with the breast. The difficult subject of the classification of the tumours of the breast has been treated in a very satisfactory manner. Especially good is the account of the operative treatment of cancer of the breast. The illustrations are numerous, and altogether the work is of the high standard of the other treatises contained in this excellent system of surgery.

MISCELLANEOUS VOLUMES.

IN *The Struggle for Scutari (Turk, Slav, and Albanian)*, by M. EDITH DURHAM (Illustrated by photographs and sketches by the Author. London: Edward Arnold. 1914. Pp. 320. Price 14*s.* net), is presented a stirring account of the events of 1911–13 in Albania, as seen by one familiar with the country and people who had special opportunities for seeing and a capacity for appreciating the complexity of the problems involved. It is not a cheerful story by any means, with its recital of atrocities and duplicities, disgraceful alike to Christianity and civilisation, but practised apparently by all sides indiscriminately during the rising against Turkey, and the contests between the different subject races that shook off her yoke. The authoress herself felt that, in carrying out her work of relief to the sick and wounded and enabling them to return to the front, she was "not only prolonging the war, but aiding and abetting every kind of atrocity," and that she ought not to do so. Particular instances are given of Montenegrin and Servian barbarities which may rank with the "Turkish atrocities" that have long been considered by many English people to be characteristic of the Moslem. The author's conclusion is that no permanent solution of the Balkan question has been arrived at. "The ethnographical questions have been ignored. ...... The seeds have been sown of hatreds that will grow and bear fruit." There are many illustrations from the author's photographs and sketches.

Dr. A. B. Neligan is physician to H.M. Legation at Teheran, and has resided for some years in the country, so he writes with knowledge in his *Hints for Residents and Travellers in Persia* (London: John Bale, Sons, and Danielsson, Limited. 1914. Pp. 195. Price 5*s.* net.) Persia is somewhat of a *terra incognita* to most Britons, and Dr. Neligan's little book contains much useful information as to life and how to live in a country which is of interest in many ways. Persia is mainly a great elevated plateau, a certain amount of which is desert, but most of which (if irrigated) is extremely fertile, while the climate is very pleasant. True, the winters are severe and the summers hot, but the air is so dry that the heat is quite bearable. This, however, is not the case in the Caspian provinces and in the districts around the Gulf, where heat and humidity are combined. Dr. Neligan's hints and instructions as to food, housing, hygiene, and other matters are straightforward and sound, though on one or two points other observers may differ from him. First, as to food. In some parts of Persia, surely, food is good both in quality and variety. True, there is no beef, but always excellent mutton; about 12 different kinds of *pilaf*, almost all good; and vegetables in abundance. Fruit in the Urmi Plain, at any rate, is magnificent, and the chickens, even the post-house breed, are quite worth eating. Secondly, Dr. Neligan says that in his experience Persia is singularly free from fleas. The reviewer did not find it so. He remembers camping for the night about half-way between Urmi and Khoi, at a place where there were no houses but a ruined stone hut, and the ground simply shimmered with fleas. Persia is a delightful country in which to travel or reside, and for those who can appreciate colour in landscape we can imagine no more fascinating place. Dr. Neligan supplements his writings on Persia with instructions as to how to get there, but has omitted to give the route *viâ* Vladikafkas, the Dariel Pass, and Tiflis. If more expensive than some others, the magnificence of the scenery makes it quite worth while taking. This is a very interesting book.

It is fitting that a notice of a work on *Travel and Politics in Armenia*, by NOEL BUXTON, M.P., and the Rev. HAROLD BUXTON, with an introduction by Viscount BRYCE and a contribution on Armenian History and Culture by ARAM RAFFI (London: Smith Elder and Co. 1914. Pp. 274. Price 5*s.* net), should follow that dealing with travel and residence in Persia, for Persia and Armenia touch one another both geographically and in many ways politically. The greater part of the work deals with politics, and on this part of the book we can say nothing. But we can cordially recommend the book to all those who desire to know something of an ancient people with a most interesting history, while apart from the Armenians the description given of the Kurdish tribes is sympathetic and lifelike. We are glad to see that the authors highly appreciate the Armenian Liturgy, for to our minds it is singularly beautiful and only excelled among Eastern Liturgies by that of Malabar and among Western by the Mozarabic rite.

Lourdes, by JOHANNES JÖRGENSEN, translated from the original Danish by INGEBORG LUND (London: Longmans, Green, and Co. 1914. Pp. 195. Price 2*s.* 6*d.* net). There is less disposition in these days than formerly to deny the reality of the cures at times effected under the influence of strong emotion, religious or otherwise. The tendency of others than those whose religious principles, of whatever kind, are involved is rather to explain them as being due to subjective suggestive influence. In this book a sympathetic attempt is made to present a picture of one of the pilgrimages to Lourdes. The history of the shrine is recounted and the spectacle afforded by the pilgrimage is somewhat flamboyantly described, but when we come to look for happenings we are told only of a paralytic who became able to move her hand, a blind person who insisted that she had received her sight, but concerning whom the verdict of Dr. Boissarie, director of the Bureau des Constatations Médicales, was "Quite destroyed; impossible to see with those eyes"; and two cases of gastric ulcer in which at least a symptomatic cure apparently must be admitted. For the rest, recourse is had to the case-books of the Bureau des Constatations, from which are cited several cases, one of whom, Augusta de Muynck, was present to show that a cure effected during 1908 in 24 hours of a freely discharging abdominal fistula left after three laparotomies had been maintained. The descriptions of the cases generally are too diffuse and lacking in precision and the necessary knowledge of the relative importance of medical factors to be of much assistance to the inquiring medical man. The descriptive portion of the book, particularly the story of Bernadette Soubirous, by whose "vision" the grotto was made known, is readable enough.

JOURNALS AND MAGAZINES.

The Journal of Physiology. Edited by J. N. LANGLEY, Sc.D., F.R.S. Vol. XLVIII., Nos. 2 and 3. May, 1914. Cambridge University Press. Price 7*s.* 6*d.*—Further Observations on the Constricting Action of Adrenalin on the Cerebral Vessels, by Carl J. Wiggers. Adrenalin was perfused through the brains of animals removed from the skull after the manner described by Dixon and Halliburton. In all 13 experiments were made, and in eight of these adrenalin caused constriction of the cerebral vessels.—The Influence of Carbohydrate and Fat on Protein Metabolism: III., The Effect of Sodium Selenite, by E. P. Cathcart and J. B. Orr. The toxic effects of selenium have long been known. The authors' experiments were made on an Airdale bitch, weight 12 kilos. Throughout the series of experiments the protein content of the food was little altered, but the amount of carbohydrate was varied from 33 to 204 grammes per diem, while the fat content was varied inversely to maintain an approximate constant calorie value for the diet; sodium, 2 grammes per diem, was added to each diet. The methods used for estimating the urinary constituents are given in the text. The injection subcutaneously of a sublethal dose of sodium selenite produces salivation, vomiting, anorexia, and lethargy. The total N and urea outputs are raised as a result of the injection, a result most marked in experiments with carbohydrate-poor diets. There is no marked acidosis following the injection, as estimated by the output of ammonia, acetone, and aceto-acetic acid. After injection there is an immediate rise in the output of creatinin, with possibly a subsequent fall below normal. There is also a definite rise in the creatin output which cannot be explained by the presence of aceto-acetic acid. The output of creatin varies inversely with the amount of carbohydrate in the food. Generally it may be said that the toxic effect of the selenite was most marked when the diet was poor in carbohydrate.—The Cerebro-spinal Fluid: II., Cerebro spinal Pressure (C.S.), by W. E. Dixon and W. D. Halliburton. The C.S. pressure has been frequently measured previously, and is found to vary within considerable limits (40–72–200 mm. of water). It varies with the respiratory movements, with arterial blood pressure, with ether anæsthesia, with strychnine, and with many other factors. The authors measured the C.S. pressure by connecting a cannula inserted into the subcerebellar cisterna with a manometer containing salt solution. The movements were recorded by means of a Marey's tambour. The animals experimented on were dogs anæsthetised with morphine and urethane. Cerebral venous pressures were also recorded. Experiments were also made on the dead animal (killed by chloroform, hydrocyanic acid, or asphyxia), artificial respiration being kept up after death. The cerebral venous and C.S. pressures may or may not approximate to one another according to certain conditions, and the same rule holds true during life. The effects of changes in arterial pressure—e.g., hæmorrhage compressing blood-vessels, clamping both carotid arteries, stimulation of the vagus and sympathetic nerves—were studied, as were the effects of the C.S. pressure on cerebral venous pressure and *vice versa*. Next, the effects of substances that increase the cerebro-spinal secretion—choroid extract (intravenous injection), chloroform, and carbonic acid gas (inhalation)—were studied. The authors conclude that the C.S. pressure is an independent pressure, and that the factors determining its height are dependent on the rate of secretion and the rate of absorption of the fluid—i.e., it is an independent secretory pressure, although it may be influenced passively by circulatory changes. The effects of adrenalin, amyl nitrite, and pilocarpine were also studied. It has been generally held that the brain being incompressible, the total blood content is almost constant (Monro-Kellie doctrine). The authors come to the conclusion that the cranial contents cannot any longer be regarded as a fixed quantity without the power of expanding or contracting in volume. The C.S. pressure is influenced passively to a small extent by changes in the arterial and venous pressures, but such alterations are insignificant compared with the independent changes in pressure which occur as the result of secretory activity. Of all the conditions which influence the C.S. secretion the authors attach the most importance to deficiency of oxygen or excess of carbon dioxide in the blood.—Vaso-motor Nerves in the Lungs, by Enid M. Tribe. A considerable number of investigations have already been made on this subject since 1894. The method used consisted in artificial perfusion of the lung *in situ* with the defibrinated blood of the animal, the circulation being maintained by means of a small pump and glass valves, the animal itself (usually a cat) being immersed in a bath of 0·9 per cent. saline at 37° C. Various preparations of "adrenalin" were added to the blood in varying proportions. It was found that all preparations of adrenalin in amounts not less than 0·01 mgm., under normal conditions of pressure and temperature, produce constriction of the pulmonary vessels of dogs, cats, rabbits, guinea-pigs, and ferrets. The constriction is followed by a dilatation, best marked in cats. The minimum amount of adrenalin capable of producing constriction is 0·01 mgm., but dilatation is obtained with only 0·00002 mgm. The effects are due to action on the smaller arteries and arterioles, not merely on the pulmonary artery itself. Stimulation of the stellate ganglion produces slight motor effects. After ergotoxin the constrictor effect of adrenalin is lost, only dilatation being produced. It is concluded that the constriction is due to vaso-constrictor nerves of sympathetic origin.—On the Effects of Complete and Incomplete Castration upon Horn Growth, by F. H. A. Marshall and J. Hammond. The effects of removing in Hardwick sheep the testes, but retaining the epididymis, were studied. The authors' results clearly support the view that the testes elaborate one or more hormones which either directly or indirectly act as a stimulus to the tissues from which the horns develop.—The Carbon Dioxide Production of Heat Rigor in Muscle and the Theory of Intramolecular Oxygen, by W. M. Fletcher and G. M. Brown. This is a very important paper, as it practically disposes of the views of muscle physiology commonly associated with the names of L. Hermann ("inogen theory") and Pflüger ("intramolecular theory"). To grasp the importance of the question the whole paper with its critical discussions should be read. The CO_2 discharge of heat rigor—the discharge at temperatures between 40° and 100° C., and from heated muscle after survival in or without oxygen, after chloroform rigor, and after the addition of acid, were studied. The summary of the authors' conclusions occupies a page and a half. All the experiments point to the conclusion that in the muscle the respiratory oxidation process yielding CO_2 as an immediate product has its chief end in the supply of energy for replacing the lactic acid in the molecular position from which stimulation of same kind has displaced it, and there appears to be no reason at present for supposing that the material which is oxidised in the respiratory process is the same as, or related to, the material from which lactic acid appears, and into which, as it seems, it may again disappear.—Observations on Decerebrate Rigidity, by Lewis H. Weed. Decerebrate rigidity manifests itself as a prolonged enduring contraction of the extensor muscles. Experiments were made on about 50 cats. The effects of various cerebellar ablations on the rigidity, the pathway in the cerebellar peduncles, the mesencephalic reactions, and the inhibitory pathway were investigated. The author concludes that (1) the main reflex centre, and in that sense the source of decerebrate rigidity, lies in the mid-brain, and is probably the nucleus ruber; (2) the cerebellum forms a very important, if not absolutely essential, pathway for the afferent impulses from the limbs and trunk concerned in decerebrate rigidity; (3) the cerebellum forms an essential link in the inhibitory pathway from the cerebral cortex; and (4) the localisations of the cerebellum, as far as can be ascertained from study of the rigidities in various extremities, are not sharply circumscribed or very minutely differentiated.—Is Polished Rice plus Vitamine a Complete Food? by CASIMIR FUNK. Experiments were made on pigeons fed on "synthetical diet," and others on polished rice, and they all manifested typical beri-beri symptoms. Injections of the "vitamine-fraction" caused complete recovery. From these and other experiments the author concludes that polished rice and vitamine constitute a complete food, and that there is no justification at present to accept the necessity of two different vitamines, one for curing the nervous symptoms and one for the maintenance of body weight.

THE PREVENTION OF INSANITY.

ON July 16th a deputation waited upon Mr. Herbert Samuel, President of the Local Government Board, to advocate the provision of greater facilities for the non-compulsory treatment of early and uncertifiable mental cases. The following composed the deputation:—Sir John Jardine, M.P., Dr. Christopher Addison, M.P., Dr. W. A. Chapple, M.P., Mr. Percy Alden, M.P., Mr. J. W. Hills, M.P., Sir Henry Craik, M.P., Mr. T. E. Harvey, M.P., Sir Rickman Godlee, Dr. F. W. Mott, Dr. Howard Tooth, Dr. H. Sainsbury, Dr. Ivo Geikie Cobb, and Dr. S. E. White (honorary secretary). Lord Robert Cecil, M.P., had intended to be present, but was detained elsewhere, while Sir Francis Champneys, Sir Wilmot Herringham, and Dr. Grainger Stewart wrote expressing regret at being unable to attend.

Sir JOHN JARDINE, in introducing the deputation, read the following recommendation which has been widely signed by leading medical practitioners, and by 330 Members of Parliament of all shades of political opinion:—

"We, the undersigned, desire to advocate the provision of greater facilities for the treatment of incipient mental cases without certification. The strong popular prejudice, the loss of liberty, and the atmosphere of certified asylums combine to deter patients and their friends from seeking early and efficient treatment. We consequently recommend that certification should be restricted to those cases in which, from the serious nature of the malady, it has become necessary, and that incipient cases should have more opportunity of temporary preventive treatment in reception homes, observation wards of Poor-law infirmaries, or the wards of general or special hospitals."

The medical signatories to this recommendation are as follows:—

London: Dr. Edwin Ash, Miss L. B. Aldrich-Blake, M.S., Miss L. Garrett Anderson, Sir Thomas Barlow, Sir John Rose Bradford, Sir John Broadbent, Mr. C. A. Ballance, Mr. A. Boyce Barrow, Dr. S. H. Belfrage, Mr. Stanley Boyd, Miss A. Helen Boyle, Dr. E. Honor Bone, Dr. W. P. S. Branson, Dr. J. Mitchell Bruce, Dr. E. Farquhar Buzzard, Sir Francis Champneys, Sir W. J. Collins, Sir John Collie, Mr. James Cantlie, Dr. J. Walter Carr, Dr. Harry Campbell, Dr. J. Stansfield Collier, Dr. W. S. Colman, Dr. Dorothea Colman, Dr. F. William Cock, Dr. Ivo Geikie Cobb, Dr. E. Davies Colley, Dr. Maud M. Chadburn, Dr. James Calvert, Mr. H. Work Dodd, Dr. T. R. Elliott, Mr. Willmott Evans, Miss Frances Ede, Sir David Ferrier, Dr. H. Morley Fletcher, Mr. Percy Flemming, Dr. Emily E. Flemming, Dr. R. Hingston Fox, Dr. Selina Fox, Sir Rickman Godlee, Sir Alfred Pearce Gould, Miss E. Grace Garratt, Dr. Leonard Guthrie, Dr. Henry Head, Sir Victor Horsley, Professor W. D. Halliburton, Sir W. P. Herringham, Dr. George Johnston, Dr. H. Macnaughton-Jones, Dr. M. Sophia Jevons, Dr. W. Douglas Kirkwood, Miss Gertrude Keith, Mr. J. B. Lawford, Dr. Constance E. Long, Dr. Octavia Lewin, Dr. F. W. Mott, Dr. Sidney Martin, Sir Malcolm Morris, Dr. E. D. Macnamara, Dr. James Mackenzie, Dr. Hector Mackenzie, Dr. Isabella Macdonald, Dr. R. O. Moon, Dr. Hector Munro, Dr. J. B. Muirhead, Dr. C. M. Murrell, Dr. George Ogilvie, Dr. J. A. Ormerod, Dr. Frederick S. Palmer, Mr. J. Herbert Parsons, Dr. Arthur G. Phear, Dr. Winifred S. Patch, Dr. Henry Rayner, Dr. J. S. Risien Russell, Dr. Amand Routh, Sir George H. Savage, Dr. Mary Scharlieb, Dr. G. E. Shuttleworth, Dr. Agnes Savill, Dr. Harrington Sainsbury, Dr. Amy Sheppard, Dr. T. Grainger Stewart, Dr. Mary C. Scott, Dr. Purves Stewart, Sir John Tweedy, Dr. James Taylor, Dr. Frederick Taylor, Dr. Howard H. Tooth, Dr. W. Aldren Turner, Dr. Rose Turner, Dr. A. Campbell Thomson, Miss May Thorne, Dr. Samuel West, Professor A. D. Waller, Dr. Florence E. Willey, Dr. Hugh Wingfield, Dr. Jane Walker, Dr. Helen Webb, Dr. L. Woodcock, and Dr. A. Davis Waite.

Birmingham.—Mr. Gilbert Barling, Mr. Seymour Barling, Dr. Stanley Barnes, Mr. Frank Barnes, Mr. W. Billington, Dr. Guy J. Branson, Dr. H. Langley Brown, Dr. Violet A. Penrose Coghill, Mr. Alfred Paget Evans, Dr. Frederick Edge, Dr. J. G. Emanuel, Mr. J. Jameson Evans, Dr. F. W. Foxcroft, Dr. W. Pemberton Fooks, Dr. W. B. Featherstone, Mr. W. F. Haslam, Mr. George Heaton, Dr. R. Beatson Hird, Mr. A. E. W. Hird, Dr. John T. Hewetson, Mr. J. Fourneaux Jordan, Mr. F. Emrys Jones, Dr. O. T. Kauffmann, Dr. William Lamb, Mr. Albert Lucas, Dr. Edward Malins, Mr. Christopher Martin, Mr. F. Marsh, Mr. J. T. J. Morrison, Mr. G. Percival Mills, Dr. W. J. McCardie, Dr. Caroline E. O'Connor, Dr. Leonard G. Parsons, Dr. C. E. Purslow, Dr. W. A. Potts, Dr. James W. Russell, Dr. John Robertson, Sir Robert M. Simon, Dr. Robert Saundby, Dr. C. W. Suckling, Dr. J. Douglas Stanley, Dr. James E. H. Sawyer, Dr. Mary D. Sturge, Dr. Peter Thompson, Dr. Thomas Wilson, Mr. Beckwith Whitehouse, Dr. E. Wood White, Dr. Beatrice Webb, and Dr. William H. Wynn.

Liverpool.—Dr. John Hill Abram, Sir James Barr, Dr. Thomas R. Bradshaw, Mr. H. Briggs, Dr. Robert J. Buchanan, Mr. Thomas H. Bickerton, Dr. J. M. Beattie, Dr. Richard Caton, Dr. T. B. Grimsdale, Dr. A. Gordon Gullan, Mr. Damer Harrisson, Dr. John Hay, Miss Frances Ivens, M.S., Dr. Charles McAlister, Dr. J. C. McDougall, Dr. Benjamin Moore, Mr. R. W. Murray, Mr. Rushton Parker, Dr. W. Permewan, Mr. Frank T. Paul, Dr. Nathan Raw, Mr. Charles H. B. Shears, Dr. G. Stopford Taylor, Dr. W. B. Warrington, Dr. J. Hayward Willett, and Dr. Courtenay Yorke.

Manchester.—Dr. Judson Bury, Dr. J. Grey Clegg, Dr. Catherine Chisholm, Dr. J. R. Carver, Dr. H. Cully, Dr. Archibald Donald, Professor Sheridan Delépine, Dr. A. Hill Griffiths, Dr. A. Emrys-Jones, Dr. C. Paget Lapage, Dr. Charles H. Melland, Dr. F. Craven Moore, Sir William Milligan, Dr. Ernest S. Reynolds, Dr. S. M. Ross, Dr. Arthur Sellers, Dr. W. Fletcher Shaw, Dr. E. J. Sidebotham, Mr. W. Thorburn, Mr. F. H. Westmacott, Dr. Robert B. Wild, Mr. Philip R. Wrigley and Mr. Garnett Wright.

Leeds.—Dr. Alfred G. Barrs, Mr. L. R. Braithwaite, Dr. de Burgh Birch, Mr. Edward W. Bain, Dr. T. Churton, Professor Cameron, Mr. Harold Collinson, Dr. E. O. Croft, Mr. J. A. Coupland, Mr. J. F. Dobson, Mr. T. W. Daw, Dr. T. Wardrop Griffith, Dr. John B. Hellier, Dr. J. K. Jamieson, Mr. R. Lawford Knaggs, Dr. Carlton Oldfield, Dr. M. Phillips, Dr. Henry S. Raper, Mr. E. Robinson, Dr. W. H. Maxwell Telling, Dr. Rawdon A. Veale, Dr. C. Wilfred Vining, Dr. George W. Watson, Mr. Henry Secker Walker, Dr. A. L. Whitehead, and Dr. W. McGregor Young.

Sir JOHN JARDINE said that the view of the committee which he represented was embodied in the following memorial:—

> We respectfully urge that the Local Government Board should, with a view to the prevention of insanity, enable and encourage county and borough councils and other local authorities to supply or aid the supply of homes intended for the treatment of early and uncertifiable mental cases at the period when they can most easily be cured, such institutions to be subject to the approval of the Local Government Board. That patients (if suitable) should enter such homes as they would enter a hospital—i.e., on an absolutely voluntary footing, and without certification, authorisation, or compulsion. They should be controlled during their stay by the rules of the institution, but be free to leave it after giving a specified notice. Unless urgency demands certification and immediate removal to an asylum, no patient who has entered shall be certified except by independent doctors after his departure from the institution. Private patients would pay on terms similar to what they now pay in county asylums. Pauper patients of the class who are now received for observation in Poor-law infirmaries, and who are found not to be certifiable, should receive treatment appropriate to their case. Both private and pauper patients should be dealt with on modern hospital lines.
>
> No change is proposed in the lunacy laws or in their administration.
>
> The object of the treatment here recommended is to prevent people becoming certifiable. It is particularly desirable that these institutions should not be regarded as "half-way houses" to asylums. With a view to encouraging the public to come to them for the early treatment which is so necessary as a preventive of insanity, it is essential that the institutions here proposed *should be kept wholly outside the jurisdiction of the Board of Control.* The patients contemplated are not in any sense "mentally deficient," neither have they been certified as "of unsound mind." Hence the Board of Control, whose function it is to deal with people belonging to the aforesaid two classes, is not concerned with individuals such as are here described *previous to certification.*
>
> We would also respectfully urge that the Local Government Board, as the authority concerned with public health, has an interest in encouraging the prevention of all forms of illness, bodily or mental, which may result in those who are affected by them becoming a permanent charge on public funds. We cannot regard with idle complacency the annually increasing and alarming accumulation of the registered insane in our asylums. The spread of insanity is not being checked by the way in which it is at present treated. Some measure is required of farther reaching scope, which shall antagonise the causes that lie at the root of early mental instability. We would point out that a preventive measure of this nature, if successful, would not only be a great gain to the community, but would materially reduce the expenditure on costly asylum accommodation which has become a burden pressing very heavily upon the rates.

Dr. CHAPPLE and Dr. MOTT spoke in support of the memorial, and Mr. HERBERT SAMUEL, in his reply, noted that the essential feature of the recommendation now made to him was that the measures were to be taken apart from the Board of Control—that is to say, outside the jurisdiction of the Lunacy Commission. If legislation were needed to carry out this purpose he feared that the prospect for the immediate future was not rosy, since Parliament was already overburdened with work; but much might be done, he thought, along the lines suggested, by administrative action. He would direct the medical department of the Local Government Board to inquire carefully into the problem and communicate with the Board of Control and to report to him upon the subject. An inquiry of this kind seemed to him necessary in order to ascertain the facts, to find out what experience had been gained elsewhere, and along what lines they should proceed administratively in default of legislation. Having carefully considered the weighty memorial submitted to him, he would not hesitate to take administrative action.

THE NEW EAST SUSSEX HOSPITAL AT HASTINGS.—The Duke of Richmond and Gordon, Provincial Grand Master of Sussex, laid the foundation-stone, on July 15th, of the new East Sussex Hospital at Hastings with masonic ceremonial. The old building has been found to be quite unadaptable for present-day requirements, and the new building, besides providing for modern requisites, will be a memorial to King Edward VII. The cost of the new hospital will be £50,000, of which a sum of about £18,000 is needed.

BRITISH PHARMACEUTICAL CONFERENCE.

FIFTY-FIRST ANNUAL MEETING.

THE British Pharmaceutical Conference inaugurated the second half century of its existence by the annual meeting which was held at Chester on July 21st and 22nd.

Mr. E. H. Farr, the President, one of the most persistent of the research workers in the pharmaceutical field, dealt in his presidential address with recent work on plant products. During the past 15 years, he said, a great amount of attention has been devoted to the study of the chemistry of plants and their products, as used in commerce, the arts, and in medicines. A great advance has been made in the direction of establishing the relationship existing between allied substances found in the same or different plants, ascertaining their chemical constitution and decomposition products, and thus making practicable a considerable degree of classification, depending on the presence of definite chemical groupings common to the members of certain classes. The physical constants and general reactions of an enormous number of compounds have been recorded, and the existence of these records very considerably facilitates the work of identification of the ultimate products of plant analysis. After dealing with the classification of the alkaloids and referring to the work done in connexion with carbohydrates, fats and oils, the glucosides and the enzymes, Mr. Farr drew attention to the stabilisation of drugs—that is, the rendering permanent of the easily decomposed natural combinations in which the active constituents of plants occur by the destruction of the ferments which cause deterioration. This process, in Mr. Farr's view, will become an important phase in the pharmaceutical practice of the future, but seeing that our drugs have gained their repute on the strength of non-stabilised material, it behoves us, he thought, not to be too hasty in altering the whole of our methods; and in any steps to be taken the medical profession should, he suggests, be called on to coöperate by submitting the products to pharmacological test and to clinical practice. At the present time Mr. Farr thinks we might with advantage proceed to stabilise our liquid extracts and concentrated infusions, the proportion of alcohol in most of these preparations being too low to stop the action of any enzyme present. "Strictly speaking," he said, "these matters should be in the province of a Pharmacopœial Committee, representing the medical profession and our own calling, and the funds proceeding from the sale of the Pharmacopœia should be devoted exclusively to defraying the expenses connected with its production, including the investigations required in that connexion. Hitherto practically all the work done with the object of bringing the volume up to date has been undertaken by manufacturing firms and by private pharmacists, their suggestions later on being adopted by the editors appointed by the General Medical Council to draft the monographs and edit any new edition."

Sixteen papers were communicated to the Science Section. Mr. H. Finnemore and Mr. E. Williamson contributed a paper of no little usefulness to prescribers, the subject being "The Incompatibility of Strychnine and Nux Vomica with Alkalies, Iodides, and Bromides." Very few systematic experiments have been recorded respecting the limits in which strychnine may be dispensed with alkaline substances without precipitation, and the series of investigations conducted by the authors shows that, speaking generally, there is a great difference between the amount of strychnine hydrochloride that can be administered with alkalies when in solution in water and when in the form of the tincture or the liquid extract of nux vomica. In the first case, should crystallisation occur, the alkaloid is deposited in well-defined crystals, which are in some cases fairly large, while with nux vomica preparations, although there is often a deposit, this is usually amorphous and does not appear to be alkaloidal. Of these two the tincture would appear to be the safer, because the alcohol in the latter retards crystallisation. The most striking feature of the experiments is the difference in the behaviour towards alkalies of strychnine in the form of the solution and that existing in its natural state in admixture or combination with those other ingredients of nux vomica seeds which are extracted with alcohol. It appears that whereas strychnine and alkalies or iodides may become dangerous under varied and indeterminate conditions when the drug is given in the form of the tincture or liquid extract, no precipitation occurs and no danger need be apprehended provided the concentration is not greater than that found under normal conditions of prescribing and dosage.

Mr. Finnemore also contributed a useful paper on the Anæsthetic Ether of Commerce. Although not recognised by the current Pharmacopœia, anæsthetic ether of commerce is largely prepared from industrial methylated spirit; the author examined the products of practically all the British makers, and "it is only fair to say that, while some samples have been rather inferior in the main, they have reached a very fair average of purity." Incidentally, it is interesting to note that the odour of ether is a very useful guide to its purity. Quite a good idea of its relative freedom from impurities may be obtained by pouring 2 c.c. or so into the hand and allowing it to evaporate, and noting the odour and that of the residue. A number of ethers in actual use as anæsthetics leave a residue which is quite pungent, and from some the residue produces violent sneezing.

Liquid extract of male fern is one of the most nauseous drugs in the British Pharmacopœia, and it is not an easy matter to present it in a palatable form. In his paper on the subject Mr. F. W. Crossley Holland suggested that it should be administered in the form of a jelly, the following being the formula:—

Liquid of extract of male fern	90 minims.
Gelatin	56 grains.
Glycerin	1 drachm.
Elixir of saccharin	5 minims.
Oil of cinnamon	1½ "
Water	265 "

These ingredients manipulated by an experienced dispenser form a not unpalatable preparation.

With the object of removing the uncertainty concerning the composition of "tinctura iodi decolorata," investigations were undertaken in the Pharmaceutical Society's Chemical Research Laboratories by Mr. W. R. Pratt, who communicated the results of his experiments. He finds that the finished tincture is an alcoholic solution of ammonium iodide with excess of ammonia, containing about 0·1 per cent. iodoform and in some cases traces of ammonium iodate, hydroxylamine, and acetaldehyde.—Commercial standards for "dried magnesium sulphate, sodium sulphate, and sodium phosphate" were suggested by Mr. J. C. Umney and Mr. C. T. Bennett. who pointed out that commercial samples of these dried salts are not of constant composition.

Owing to a shortage in the supply of belladonna leaves adulteration has, especially of late, been largely practised. In a paper dealing with this question Mr. G. Stafford Allen and Mr. H. Deane brought together a description of the chief diagnostic characters of these substitutes. The adulterants found were phytolacea decandora, scopola carniolica, and ailanthus glandulosa, and samples offered as belladonna leaves have consisted of pure scopola, mixtures of phytolacea and ailanthus, and mixtures of belladonna with each of these substitutes, the proportion of substitute varying from about 20 to 80 per cent.

In a paper entitled "The Purity of Pepsin, Bacteriologically Considered," Mr. E. Quant reported on 11 samples of pepsin in powder and scales from English, American, and continental sources which he had investigated with a view to determining their bacteriological condition. His conclusion is that the bacteriological purity of pepsin is hardly satisfactory, but that scale pepsins are superior to the powders, those which showed an acid reaction being preferable.

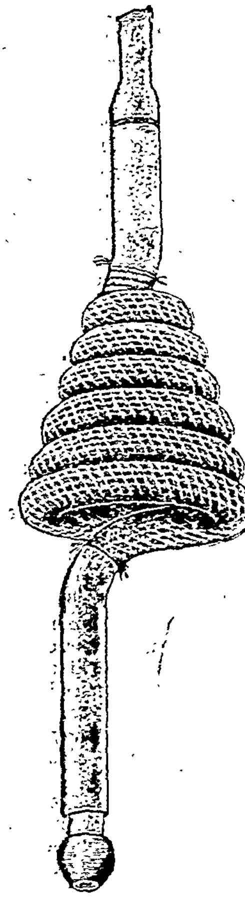
Mr. R. R. Bennett and Mr. T. T. Cocking suggested an improved process for the preparation of "liquor opii sedativus."

The titles and authors of the other papers read in the Science Section were as follows:—The Rate of Dialysis of Alkaloids in Aqueous Solution and in the Form of Galenicals, by H. Finnemore; the Analytical Characters of Benzoin, by T. T. Cocking and J. D. Kettle; the Mineral Constituents of Certain Tinctures and Drugs, by S. Judd Lewis; the Stability of Cinnamic Aldehyde, by H. A. Phillips; the Determination of Iron in the Presence of Phosphorus, by C. E. Corfield and W. R. Pratt; the Place of Carbon Disulphide in Official Pharmacy and Suggestions for its Further Use, by F. H. Alcock; the Composition of the Glycerophosphates of Commerce, by J. C. Umney and C. T. Bennett; and Some Uses of a Tincture Press, by E. W. Pollard.

New Inventions.

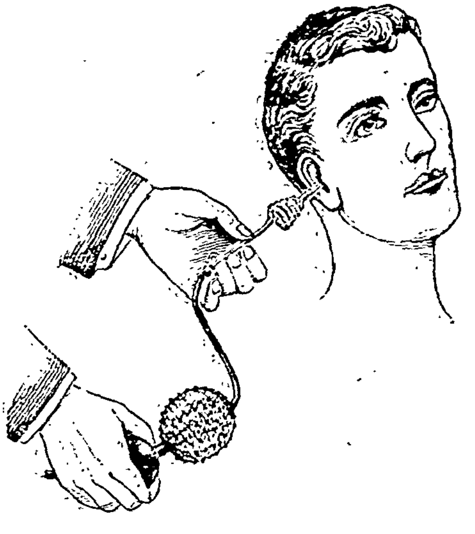
A COLD AIR LABYRINTH TESTING APPARATUS.

FIG. 1.



THE value of the caloric test for the activity of the vestibular section of the internal ear is now well established. It is at present mainly carried out by the irrigation of the ear with cold water, and, as a rule, the data are in every way reliable. At the same time the use of fluid injections into the ears is contra-indicated in various conditions, such, for instance, as the presence of a perforation in the tympanic membrane after an acute or more often a chronic suppuration in the middle ear has subsided; in such circumstances a liquid injection tends to reawaken the suppuration. Of course, if it enters a deep-seated cavity in which cholesteatoma formation is going on, the distension and pressure induced may be followed by serious or even fatal consequences. A convenient means of insufflating cold air instead of injecting cold water must have been a desideratum in the minds of many practitioners, as it has been in that of the writer. To supply this want he has devised the apparatus illustrated, which he thinks meets the requirements of the case in so far as it can be employed either on a normal membrane or on one which is perforated, either with or without persistence of suppuration. Again, it can be used with the head placed in such a position that the ear under investigation is directed downwards, which, though not impossible with water tests, is, to say the least, extremely inconvenient. The apparatus consists essentially of a tube of good conducting metal; aluminium has hitherto been used but copper has been found preferable. This is covered with absorbent linen webbing and is coiled in the form of a hollow cone. The covering is well wetted with chloride of ethyl and air is then blown through the tube by means of an ordinary spray bellows. When the air blown on the cheek is felt to have reached a high degree of coldness it is introduced into the meatus of the ear in such a direction that the cold blast impinges directly on the tympanic membrane. Inflation is continued until nystagmus is or ought to be induced. The free extremities of the tube are insulated by means of indiarubber tubing and a portion projects beyond the metal for insertion in the ear; the distal part of this is separated from the rest and can be easily changed to meet æsthetic or aseptic requirements. When the bore of the metal tube was as at first uniform the air entered in a somewhat pumping way into the ear, and this was found to be extremely disagreeable; in order to make the flow of air gentle and continuous it was only necessary to use a fairly strong secondary bag to the bellows and to choke very considerably the bore of the proximal end of the metal tube. When the instrument is thus arranged the maximum of coldness is obtainable in from 12 to 15 seconds and is kept up for about 75 seconds, when more chloride of ethyl can be added easily. In most normal cases the nystagmus is induced in an average of 30 seconds, the head being thrown back 60 degrees beyond the vertical and the eyes being intermittently directed towards the opposite side at an angle of 50 degrees from the middle line (Brüning's optimum position) and up to the ceiling. Fig. 1 shows the cold air labyrinth testing apparatus and Fig. 2 the mode of employing the apparatus. (The patient's eyes ought to have been depicted looking further towards the left.)

FIG. 2.



The apparatus in its present form has been constructed by Messrs. Allen and Hanburys, Limited, of Wigmore-street, London, W.

DUNDAS GRANT, M.A., M.D., F.R.C.S. Eng.

Cavendish-square, W.

RADCLIFFE INFIRMARY, OXFORD: COMPLIMENTARY DINNER TO MR. HORATIO P. SYMONDS.—On the evening of July 16th a dinner was given at Christ Church by the committee and the medical staff of the Radcliffe Infirmary to the senior surgeon, Mr. H. P. Symonds, on the occasion of the presentation to the infirmary of a portrait sketch by Mr. J. S. Sargent, R.A. Among those present in addition to the medical staff were the mayor of the city, the president of Magdalen, Mr. Gamlin, the treasurer of the infirmary, the secretary, Captain G. C. Rynd, and a number of old house physicians and house surgeons, the senior of whom was Mr. A. Winkfield, to whom Mr. Symonds was originally apprenticed. Sir William Osler, in presenting the portrait, remarked that Mr. Horatio Symonds was the seventh surgeon in direct succession from Richard Symonds, who practised at Atherstone, in Warwick, in the early part of the seventeenth century. His son Joshua was a surgeon at Shrewsbury; the third, John, practised at the same place; and the fourth, also a John, at Kidderminster. His son John practised at Oxford, and was the father of Frederic, for many years a surgeon to the Radcliffe Infirmary, whose son Horatio succeeded him. For three centuries the Symonds had served the public of that part of England in the capacity of surgeons. A son of the first John who settled in Oxford, John Addington, who practised at Bristol for many years in the middle of the last century, became one of the most distinguished physicians of his generation. His son, of the same name, became the interpreter of the Italian Renaissance to the last generation, and his daughter, Mrs. Green, a member of the committee, was one of warmest friends the infirmary had ever had. Horatio Symonds studied at University College, and after qualifying in 1874 settled in practice with his father, and soon became the leading surgeon of the Oxford district. He was elected on the staff of the infirmary in 1878, and was largely instrumental in introducing the new methods of Listerian practice. It was well known that it was through his influence that the late Mr. Briscoe left the infirmary the large sum of nearly £65,000, which had made possible the recent additions. Sir William Osler then read an exceedingly gracious letter from Mr. Sargent, to whom the company voted their hearty thanks for the splendid representation of the well-known features of their old and valued friend.

THE LANCET.

LONDON: SATURDAY, JULY 25, 1914.

A Week of Congresses.

NEXT week will be a very busy one in the medical and scientific world. Two congresses of first-class medical importance will be proceeding in the United Kingdom—viz., the British Medical Association, which holds its eighty-second annual meeting at Aberdeen, and the Clinical Congress of Surgeons of North America, which holds its fifth annual session in London. During the same week the French Association for the Advancement of Science is meeting at Havre and welcoming many members of the kindred British body who are unable to be present at the annual meeting which this year takes place in Australia. The programmes of the two medical congresses have for some time been before our readers, who know therefore the particular fields of medicine, surgery, and pathology that it will be designed especially to cover, and who know also that the activities of the British Medical Association are every whit as pronounced in the direction of medical politics as in that of scientific progress. We are leaving out of consideration here the political functions of the British Medical Association, and considering the two medical Congresses as designed especially to further medical knowledge, to standardise clinical achievement, and to explain technique and procedure.

In each case the Congresses will follow what has now become a formal arrangement in the conduct of such gatherings. At the meeting of the British Medical Association the plenary addresses are three in number and will be delivered by Sir ALEXANDER OGSTON, the President, by Dr. A. E. GARROD, who will deliver the address in Medicine, and by Sir JOHN BLAND-SUTTON, who will deliver the address in Surgery. Then the work of the meeting will be done in sections, at which presidential addresses of varying importance will be delivered, the different presidents interpreting their duties to the chair as they choose. Thereafter certain set subjects will be debated in the particular sections, the initiation of the discussions having been committed to selected observers. The remaining time of the session will be occupied as usual by the reading of independent papers, which have been approved of as suitable, and for the communication of which time can be made. Roughly this pattern will be followed at the American Congress, although here we have the organisation applied to one subject, that of clinical surgery. Here also we have preliminary addresses delivered by Sir RICKMAN GODLEE, chairman of the London Committee of the Congress; by the Hon. W. H. PAGE, the American Ambassador; and by Dr. G. E. BREWER, of New York, and Dr. G. E. ARMSTRONG, of Montreal, respectively the retiring President and the Vice-President of the Congress. In addition to these preliminary and official addresses there will be clinical addresses by Professor VON EISELSBERG, of Vienna, who will speak on the choice of operation in ulcer of the stomach; and by Dr. J. B. MURPHY, of Chicago, the President for the year, who will open a debate upon the limitations and technique of arthrodesis and bone-transplantation. In both the general and special surgical divisions of this Congress important subjects have been selected for debate, and the discussions will be opened by men who are famous for the work which they are doing and the views which they hold. But the American Congress is a clinical rather than an academic one, and its work will therefore be supplemented by a remarkable series of hospital visits such as would not be possible in connexion with any but a well-defined special gathering held in a great capital city. The main hospitals in London have offered their clinical practice for the inspection of the members of the Clinical Congress of Surgeons of North America, when opportunities for observation and informal discussion will arise among men exceptionally qualified both to give information and to sift it when given, such as must be absent as a rule from any mere general scientific gathering. Chances will thus obtain for the clearing up of doubts among the protagonists of different views, additional to those offered by set debates.

The utility of scientific congresses, whether international or domestic, general or special, has been challenged of late on the ground that far too much is said at the meetings that is not of any importance. The same judgment has at different times been passed upon gatherings as important as those of the British Association for the Advancement of Science, as well as upon the numerous semi-popular congresses now being held with frequency in this country. Those who follow this line can find much to support them, but in our opinion, when medical congresses are in question, the critics do not take sufficient account of the care that has been expended lately in the organisation of these gatherings to suppress loose and desultory talk, to check the recording of experiences that are not to the point, and to prevent the laborious refutation of views that are no longer held. Every year the attempts are multiplied to make medical congresses into meetings of thinkers and doers by employing some such scheme of arrangement as that which has been already indicated and under which certain points only, at any rate in any set programme, come up for debate. But it must be admitted that the critics sometimes have right on their side when they say that despite all pains thus taken a large amount of time may be wasted. We do not think it therefore irrelevant to suggest to those who intend to take an active part in the congresses now imminent that they should assist the organisation of the meetings by conciseness in their communications and brevity in their speeches.

The Report of the Chief Inspector of Factories.

THE report of the Chief Inspector of Factories and Workshops for the year 1913, which has just been issued, will be welcome to all who are interested in the relation which exists between industrial employment and disease. This report bears evidence of excellently designed administration, of careful study of the conditions affecting safety and health, and of efficiency in the methods adopted to limit as far as possible the injuries which result from industrial occupations. Sir ARTHUR WHITELEGGE'S period of office has been characterised by marked advances in the knowledge of industrial disease and of the methods by which it can be controlled, and his present report affords evidence of the progress which is continuously being made in these directions. Some idea of the extent of the work which devolves upon the department is shown by the number of premises which come under its supervision, this number amounting in the year 1913 to over 250,000. In these factories and workshops all the conditions affecting health are under the observation of the staff of the inspectors, who thus become responsible for pointing out defects in lighting, ventilation, humidity of atmosphere, and the safeguarding of the persons employed against accident, whether from machinery or other source of risk to life and limb; they have also to deal with the enforcement of special rules for occupations which are known to have particular risks associated with them. But beyond this it is the duty of the department to make continued search for variations in health which may have relation to industrial processes; and previously unrecognised pathological conditions are from time to time found in this way and appropriate preventive measures adopted.

Among subjects which deserve attention in the report we may refer to an account by Dr. E. L. COLLIS of illness among the workers in one factory in which it was eventually found that both lead and antimony had been concerned in producing somewhat complex symptoms in those engaged in dealing with yarn dyed with yellow chromate of lead and other yarn in which antimony salts are used. Dr. COLLIS writes that "possibly in those cases in which lead poisoning was diagnosed the symptoms were complicated by the presence of subminimal doses of antimony, and in the other cases of illness subminimal doses of lead rendered toxic doses of antimony which might not otherwise have been so." The same observer has continued his investigations into the relation between mineral dust and pneumoconiosis, but has found no reason for modifying the views he expressed in his paper on the effects of dust in producing diseases of the lungs, read last August at the Seventeenth International Congress of Medicine.[1] The paragraphs in the report relating to this subject compare the death-rates from phthisis among men engaged in working oolitic limestone, which are about 1·5 per mille, with the death-rates prevailing in Derbyshire for persons employed in and about gritstone (with free silica up to 95 per cent.), whose phthisis death-rate is over 13 *per mille*. The importance of maintaining close observation in respect of the dependence of miner's phthisis upon the presence of silica in the stone which is being worked cannot be overrated. Reference is again made in the report to "weaver's cough" which had previously been the subject of a special report by Dr. COLLIS during the year.[2] This malady appears to be dependent upon inhalation of a mildew, probably a particular mildew in the warp or weft. It is suggested that the introduction of antiseptics into size should solve the problem for warp threads, but it is no use for weft threads, which are not sized. The malady is only occasionally found, and it is evidently one which should be borne in mind by all engaged in the weaving industries. Account is given of 70 cases of anthrax which were reported during the year with 7 deaths. This number is in excess of those of previous years, a fact due to increase in the cases of disease contracted from wool, probably East Indian wool; and reference is made to the tests of the Anthrax Investigation Board to decide whether steam disinfection of wool is practicable or not. In one case salvarsan was inoculated but with fatal result, apparently due to inability of the kidneys to eliminate the salvarsan after its action on the anthrax bacilli had been completed.

The above are necessarily illustrations only of the subject matter which is dealt with in the report of the Chief Inspector of Factories and in the valuable communications presented by Dr. T. M. LEGGE, the medical inspector. They suffice to show the comprehensiveness of the work of the department and the thoroughness with which it is being performed. It cannot be doubted that this work contributes substantially to improvement in the health of the large section of the population engaged in industrial occupations. It is particularly satisfactory that the spirit of research should so thoroughly permeate the labours of Sir ARTHUR WHITELEGGE and his colleagues. This is no red-tape administration, but an enlightened struggle to relieve the drawbacks and guard against the injuries which are incidental to factory life.

Annotations.

"Ne quid nimis."

THE MEXICAN SITUATION FROM A MEDICAL STANDPOINT.

FOR some time certain political parties in the United States have been calling loudly for a war with Mexico on the plea of "vindicating the national honour." With the rights or wrongs of the dispute between these nations we are not at present concerned, but our attention has been drawn to the medical aspects of the position by an article published recently in the *American Journal of Tropical Diseases and Preventive Medicine* entitled "The Mexican Situation," by Dr. Howard D. King, of New Orleans. In this article the attitude of these bellicose parties in the United States is sharply criticised, it being evident that while calling for war they do not realise the grave consequences that must inevitably follow. In Dr. King's opinion all thinking men must view with horror and dread the prospect of such a war, with the certainty of war's grim ally, pestilence, also taking the field. Behind the looming presence of war stalk the shadows of epidemic disease. The medical profession in the United States is aware, for example, that two of the most serious epidemic maladies, plague and yellow fever, are at present exhibiting signs of activity which forebode mischief, more particularly to the Southern States of the Union. It is common knowledge that the prospect of one or both of these dangerous diseases extending beyond their present limits is just now causing some anxiety in official circles; and it is generally recognised that if the United States are plunged into a war with Mexico the spread of the infection would be greatly facilitated. The present plague situation in America was dealt with in THE LANCET of July 11th, and the position as regards yellow fever is also somewhat gloomy, judging from current reports. If it became necessary to land large bodies of non-immune troops on the shores of Mexico, in parts of which yellow fever is endemic, it would be very difficult to prevent the development of a serious epidemic of the disease, with probable conveyance of the infection to the Southern ports of the United States. The way in which small-pox and enteric fever harass armies in the field is now well recognised, and although vaccination on the one hand and antityphoid inoculation on the other might diminish the dangers, yet it is more than probable that these beneficial procedures would not be generally carried out during the bustle and excitement of dispatching an expeditionary force to the seat of war. Small-pox is already prevalent on the Northern frontiers of Mexico among the refugees from those parts of the interior where military operations are being carried out. At the port of Vera Cruz, now occupied by a United States force of soldiers and sailors numbering nearly 30,000, small-pox is also prevalent; and diarrhœa and dysentery, it is reported, have increased of late. Apart from the ravages of epidemic and other diseases there would have to be reckoned, in the event of a war, the deaths and disablements upon the field of battle. The medical mind can best appreciate the horrors of war and the advantages of dealing with disputes by diplomacy rather than by the edge of the sword. The soldier takes a more sanguine and professional view of the case, and naturally prefers a settlement by force of arms. In this connexion Dr. King remarks: "War means devastation and blood, depopulated fields and smoking villages; the acclamation which the conqueror wins from one portion of his species is answered by the curses and execrations of another; the laurels of the warrior are always bedewed with the tears of widows and orphans; the delusive splendour, the proud and imposing array with which he contrives to gild the honours of his profession, are but the pomp and retinue of the Prince of Terrors; Disease, the warrior's faithful ally, is the King of Terrors." It is greatly to be hoped that, in spite of the cavils of political malcontents, President Wilson will persevere as far as practicable in his peaceful policy, which will ultimately assure in all probability the deliverance of the United States from what Dr. King designates as "a most frightful visitation of epidemic disease." The recent retirement of ex-President Huerta from Mexico should remove many of the obstacles to peace and thus prepare the way for a satisfactory settlement of the protracted dispute between these two determined nations; at the least it should postpone for a time the threatened war and its direful consequences.

CLARET AS A BEVERAGE.

WHEN, for varying reasons, a wine is to be selected because it contains the least amount of sugar, of alcohol, and of acid, the choice should obviously fall upon claret, for analysis shows that the percentage of these substances is lower in Bordeaux than in any other wines. It is quite a common impression, however, that the white wines of the hock and moselle type are more innocent than other wines in these three respects. That is not the case, although we are finding no fault with these wines. To not a few people claret appears to be a sour-tasting wine simply because it contains no sugar to speak of, which in other wines masks the acidity present. Claret is practically a finished wine—that is to say, the original sugar of the grape is for all intents and purposes completely changed by fermentation, and as the original strength of the Médoc grape juice as regards sugar is relatively weak, the amount of alcohol produced is correspondingly small. The production of claret is perhaps the simplest example of wine making. It is purely fermented grape juice with nothing added and nothing deducted. When therefore a wine becomes the subject of a prescription it would appear that we are on safe grounds dietetically when we recommend claret if qualities like freedom from sugar and from an excess of alcohol and acidity are characteristics to be sought for. When a stimulant is ordered it has been customary for some time past to recommend weak whisky and water as a safe beverage. The danger here, however, is that of overstepping the alcoholic allowance. The simplicity of genuine claret is accountable for its well-known sensitiveness, which perhaps has brought it into disfavour in some quarters. Its flavour is peculiarly evanescent and delicate and is easily spoiled by careless management. But the fact that claret will not keep sound more than a few hours after opening precludes the suggestion of preservatives, including extraneous alcohol, being added. As a rule the best clarets are the most liable to become unsound. The coarse fortified clarets keep longer for obvious reasons. Connoisseurs value sound claret for its exquisite flavour and delicacy of character. Not so many years ago the fine wines of the Médoc, including all the superior classed growths or "crus," but not them alone, commanded relatively big prices, but nowadays many excellent wines can be purchased showing all the pleasing qualities of the genuine high-class Médoc wines at a very reasonable figure. It is surprising that the medical profession and the public do not realise this fact. Excellent genuine wines, especially of the vintages 1907 and 1909, from the best districts of Médoc and St. Emilion, and embracing such well-known growths as the Châteaux Giscours, Beychevelle, Léoville, Cos d'Estournel, L'Evangile, and others, are now to be had at prices not exceeding 30*s.* per dozen, while there is a large choice of wines of exceptional quality at considerably lower prices. No apology for bringing these facts forward is needed in view of the dietetic virtues of these wines. It is very doubtful, according to our experience, based in part upon laboratory examination and in part upon the evidence of the palate, whether the supply of sound and really superior clarets was ever so good, so cheap, and so plentiful as it is now, and from the point of view of alcohol it is safe to say that if for beverage purposes at dinner or luncheon claret were substituted for diluted spirits, liqueurs, and so forth, there would be much less alcohol consumed, to the unquestionable advantage of the consumer. Also the æsthetic palate would gain by those agreeable wholesome impressions which good Médoc wines are invariably capable of giving, and appetite is thus helped. A sound claret, according to the foregoing considerations, may almost be placed in the temperance category by reason of its low alcoholic strength, and we are not disposed to think that in drawing attention to the good value in choice clarets now available to the public any possible injury to the cause of temperate living, which all reasonable persons have at heart, can arise.

A NEW TEST FOR MORPHINE.

IN a preliminary report, published in the *Medical Chronicle* for July, Dr. T. H. Oliver, medical registrar at the Manchester Royal Infirmary, describes a new reaction of morphine and its salts which may turn out to be exceedingly useful to analysts. If to a solution of morphine a few cubic centimetres of hydrogen peroxide and a little strong ammonia are added, and the mixture be stirred with a piece of copper wire, the previously colourless solution assumes a deep port-wine tint, with a considerable evolution of gas. The test is said to be exceedingly delicate, for 0·00002 gramme of morphine can be readily detected; but in dealing with very small amounts it is necessary to add a few drops of potassium cyanide solution to remove any blue colour (from the copper) which may otherwise mask the port-wine tint. It is important not to add the cyanide before the copper, as this may prevent the occurrence of the reaction. The reaction is also a very delicate one for copper, detecting 0·00001 gramme easily. It will occur if monomethylamine (NH_2CH_3) be substituted for ammonia, but not with dimethylamine, nor with caustic soda. Codein and dionin (methyl and ethyl morphine respectively), which are indistinguishable from morphine by ordinary tests, do not give the reaction; apomorphine gives an orange colour. The following alkaloids give negative results: strychnine, brucine, atropine, narcotine, heroin, cocaine, nicotine, cephalin, emetine, veratrine, physostigmine, pilocarpine, and coniine. Other substances were tried as substitutes for copper but proved useless, such as aluminium, iron, nickel, calcium, the salts of manganese, cobalt and iron; and colloidal selenium and rhodium. The red substance which is formed is insoluble in the ordinary morphine solvents, and also in ether, chloroform, and toluol; and the whole of the morphia is changed, for none can be recovered from the ammoniacal solution. Dr. Oliver does not state whether the presence of body fluids, such as urine, blood, serum, cerebro-spinal fluid, interferes with the reaction; but as his report is stated to be preliminary this point will doubtless engage his attention, for its medico-legal importance is obvious. We have tried the test described and obtained confirmatory results.

MERYCISM.

MERYCISM, or chewing the cud, is a rare phenomenon among human beings. It was first recorded in 1681 by Fabricius ab Aquapendente; he and some other writers of that epoch saw in it the mark of the beast, and even noted that merycising patients were apt to grow horns on their foreheads and the like. Nowadays it is more reasonably held to be an atavistic phenomenon, not due to an unfortunate maternal impression during pregnancy, as Peyer (1685) believed, or to gastric antiperistalsis, such as occurs in vomiting (Haller, 1764), or to pylorospasm. In 1904 Presslich collected 145 cases of merycism from the literature; most of the patients were adults, but it appears that some 30 were children; and Schippers has found records of 10 instances in infants to which he adds[1] two new cases of his own. It is a curious fact that men seem to be more prone to rumination than women except in infancy; Wirtz found 10 women among over 140 merycists, while 7 out of 11 ruminating infants were girls. The habit is generally adopted between the ages of 5 and 15, and it appears that heredity, or perhaps imitation, is an important factor in its occurrence; it is not evidence of feeble-mindedness or idiocy, as has sometimes been supposed. Yet it is very much under the control of the nervous system. Some patients indulge in merycism only after partaking of certain kinds of food—vanilla ice, for example, or liquid and not solid food; infants may cease to ruminate when exhibited for demonstration purposes, or when an X ray examination is to be made. It appears that there is an optimum quantity of food that should be given to these infants when merycism is to be provoked, which was about four ounces in one of Schippers's patients. There is no doubt that in infants the habit is a bad one, leading to chronic malnutrition. In none of the 12 recorded cases was the child up to its proper weight, and in several the temperature of the body was often subnormal, falling as low as 91° F. The outlook is less favourable when the merycism is combined with dyspepsia, as is often the case with infants. The object of treatment in these patients must be to prevent the child from merycising. It should be given food that it does not care to ruminate, in quantities (usually small) that do not provoke rumination; being a neuropath, it should be kept quiet, and it is not likely to benefit by the exhibition of sedative drugs. As for adult merycists, Schippers indicates the necessity of determining how far rumination is akin to vomiting—a question that might well be answered by X ray examinations. It appears that the adult patients themselves clearly distinguish between the two processes. To describe merycism as a reflex movement, or even as a "Bedingungsreflex" as described by Pawlow and Czerny, a conditional reflex dependent upon an association of ideas rather than any direct stimulus, does little to advance our comprehension of the phenomenon. Schippers points out that both his infant patients might begin to chew the cud while asleep, waking up at once, while Wirtz states that merycism may go on during dozing; yet the true associative reflex can only occur in persons who are awake.

MR. H. G. WELLS ON MEDICAL BIBLIOGRAPHY.

Mr. H. G. Wells's paulo-post-future tense is somewhat hard on the arduous achievements of the present. In his "World Set Free" we are told that in 1970 or so the world will have been benefited by vast improvements in surgery and medicine, and these will have been in great part the result of a tremendous system of research indexing, which, while preventing the medical men of the future from doing the same work twice, will constantly tend to keep them in touch with the newest discoveries and the most notable recent cases, as well as all the ancient literature of their subject. "Of course, the present indexing of research is in itself a very big work, and it is only now that we are getting it properly done," says Mr. Fowler, an English or American surgeon of the far future, addressing his eminent Russian patient in the presence of the Italian director and the Finnish matron of "the new station for surgical work at Paran, high in the Himalayas." In old days, according to Mr. Fowler, indexers were a mean paid race; in 1970 they work for the love of the thing, a truly damnable practice from the darkened point of view of 1914. Mr. Fowler's patient, a Russian cripple, has contributed to world-thought the scarcely original discovery that self must be abolished in favour of society, and Mr. Fowler is about to kill him up in the surgically aseptic Himalayas, and he is glad to talk a little shop before succumbing! It is only natural. But is it fair for 1970 thus to patronise 1914? True, we grant that in 1970 probably a thousand persons will be "thinking hard" to one who did so in 1900, but we must still set up our feeble protest against this wholesale snowing under of the present. Medical indexing is not neglected among us. Apart from the magnificent "Index Medicus" of the Surgeon-General in Washington, the whole of the medical literature stored in London has been very fully indexed. True, only author-titles of books and pamphlets, and subject-titles derivable from these, are indexed in England, but in America magazine and periodical articles are recorded as well. If, as Mr. Wells seems to suggest, every case, every operation, every separate subject, mentioned in the course of every article were indexed, the resulting mass of catalogue cards would be so enormous as to stultify research itself. The researcher would be lost in a labyrinth of facts, most of which would be of very little use to him. At present the indexer, who in England is not, as a rule, specifically paid as such, knows that the title of a modern article is fortunately a fair indication of its contents, but, like a faithful worker, he rarely omits to mention any salient subject which may be recorded therein. Thus in recording the title of an ancient book—say Alpinus on the Medical Botany of the Ancient Egyptians—the good indexer who is also an alert reader will mention the balm of Gilead, with which that remote work greatly deals, but the shortness of human life will prevent him from indexing the whole work page by page. What Mr. Wells's Mr. Fowler should have said is that in 1970 an index of all important cases is being kept, and not an index of every subject in every book. Cases are the gist of medical literature.

UMBILICAL SINUS DUE TO A PIN IN THE APPENDIX.

IN the *Australian Medical Journal* of May 23rd Dr. R. M. Downes has reported the following curious case. A healthy-looking girl, aged 3½ years, was seen. The history was that 16 months previously a small protuberance from the umbilicus was noticed. It discharged pus two days later, and this subsequently occurred from time to time. The discharge at times had an offensive odour, but not suggestive of bacillus coli infection. From the apex of the protuberance a probe could be passed for about 1½ inches in a caudal direction. The sinus was filled with bismuth paste and under the X rays was seen to form a small pouch situated slightly to the right of the middle line. Methylene blue injected into it did not appear in the urine. She was shown at the Pediatric Society as a case of cyst of the urachus. The sinus was curetted and mopped with tincture of iodine without benefit. The discharge continued at intervals for a year, the longest period at which it was absent being four months. At the end of this time it was more profuse than ever, and it was decided to adopt radical measures. Under chloroform the probe was now found to pass 4 inches in a lateral and downward direction, and for the first time a mass was felt in the right iliac fossa. A vertical incision was made to the right of the middle line, the anterior layer of the rectus muscle was opened, the muscle was displaced laterally, and the probe was cut down on. The tract was found to be internal to the transversalis fascia, the sinus was swabbed with iodine, and the layers were united. The discharge continued to be profuse and the mass remained unchanged. Three weeks later the incision was reopened and extended. On cutting down on a director in the sinus a black and coated pin was found, and the peritoneal cavity was opened. The mass previously felt was partly due to a structure adherent to the peritoneal end of the sinus and running towards the cæcum. This was first thought to be a Meckel's diverticulum, but after the mass was separated it was found to be an appendix arising from a cæcum of the fœtal type. The appendix was removed, the wound sutured as far as possible in layers, and the septic umbilicus cut out, a small tube being left in for 24 hours. Recovery was uneventful. The appendix and surrounding tissues were very thickened. The distal end, where it was adherent to the sinus, was bulbous, and closed from the rest of the appendical lumen by an impermeable stricture. The mucous membrane showed signs of previous inflammation. No communication with the umbilical sinus could be demonstrated. A urachal cyst may have been present into which the pin was accidentally introduced, and the appendix may have become adherent to the peritoneum covering this cyst internally. But Dr. Downes thinks it much more likely that a swallowed pin passed into the appendix—an occurrence which would perhaps be more easy owing to the latter's fœtal type of origin from the cæcum; that it then caused inflammation of the appendix, with adhesion to the parietal peritoneum in the region of the umbilicus, and finally passed through into the abdominal wall, where it remained embedded, the resultant pus finding a route of egress by the umbilicus. In either case it is curious that so much inflammatory change in the appendix and fixation of the cæcum should not have given rise to abdominal pain or intestinal disturbance.

TEMPERATURES IN SCHOOL CHILDREN.

IN continuation of the series of Research Memoirs of the Drapers' Company, the statistical department of University College, London, has issued a contribution on national deterioration entitled, "A Statistical Study of Oral Temperatures in School Children, with especial Reference to Environmental and Class Differences."[1] It is the joint production of Mrs. Mary H. Williams, M.B., Miss Julia Bell, M.A., and Professor Karl Pearson. Most of the materials for this investigation were collected by Dr. Mary Williams in the course of her duties as medical inspector of schools in Worcestershire. They include the taking of the temperatures of nearly 3000 children, record being kept of the age, weight, and height of the children individually. They were also examined clinically with respect to the presence or absence of definite disease, and were classed accordingly. The diagnosis was wholly independent of the temperatures, the object being to test how far temperature may be relied on as an indication that further examination as to pathological condition was required. In order to compare the physical condition at stated ages of boys in elementary schools with that of boys of a different social class appeal was successfully made to the headmasters of Winchester and Charterhouse. Similar comparison of the girls was secured through the courtesy of the headmistress of the great public schools at St. Andrews, and of the lady superintendent at the Royal Soldiers' Daughters' Home at Hampstead. The results of medical inspection respecting the relation of pulmonary tuberculosis to rheumatism among school children are very interesting. The authors explain that diagnosis was based on the following characters. Pulmonary tuberculosis was indicated by physical signs alone, not symptoms; the common signs found being persistent localised basal dulness with râles. Rheumatism was diagnosed on: (*a*) clear history of "*growing pains*"; (*b*) presence of mitral disease; (*c*) history of chorea. As far as practicable, inquiry was made as to the occurrence of tuberculous or rheumatic affections in either or both of the parents. In summarising the results of their investigation the authors affirm the existence of a real and marked difference between the children of the upper and lower classes, the temperatures of the poorer children at the several ages being undoubtedly the higher. No observations of these conditions were practicable at the public schools, but the authors suspect this higher temperature to be due to the greater prevalence in the poorer classes of "puerile phthisis" and rheumatism. The rheumatism is probably of a markedly hereditary character; the puerile phthisis appears to be also partly hereditary, but it is also partly due to greater risk of infection in some of the primary schools, or to an environment favouring the development of an infection received elsewhere. With regard to the high temperatures recorded in certain of these schools, the authors suspect that they run through epidemics of puerile phthisis at different seasons and with different degrees of severity. An important statement is noteworthy with reference to rheumatism and phthisis in early life. The authors agree in affirming that no child is affected with both these conditions; the two poisons appear to be antagonistic. Dr. Williams states that in the thousands of children she has examined she has never seen a case in which she was certain that the two diseases coexisted in an active stage, and only two cases in which she was doubtful on this point. The observation agrees with a previous statement by Sir Dyce Duckworth that one of the most remarkable features of the arthritic diathesis is its resistance to the inroads of tuberculosis. Dr. R. H. Miller, of the Paddington Green Children's Hospital, is also quoted by the authors as writing that rheumatism and tuberculosis are very seldom found active in the same subject. There is apparently some evidence that the one infection tends to protect against the other, but we do not agree with the author's conclusion that pulmonary tuberculosis is a common disease in childhood, since other basic conditions, such as bronchiectasis and collapse, would have to be excluded in such an inquiry as this.

THE SIMULATION OF ANEURYSM BY OTHER AORTIC AND CARDIAC DISEASES.

X RAYS have aided largely the diagnosis of thoracic aneurysm. Mediastinal growths can in a majority of instances be thus distinguished from aneurysm. There are, however, certain aortic conditions which closely *resemble* aneurysm. Usually the conditions are of syphilitic origin—a syphilitic aortitis. General aortic dilatation may show marked episternal pulsation. Again, as Dr. Carey F. Coombs points out,[1] arterio-sclerosis may imitate aneurysm, and so, also, may cases of aortic dilatation associated with aortic valvular incompetence. In all these cases some of the physical signs of aneurysm are produced. There is on either side of the manubrium sterni a strip of dulness extending as far as two fingers' breadth beyond the sternal margin on the right and rather less on the left. Pulsation is visible at the inner ends of the second and third right intercostal spaces. Often the aortic second sound is accentuated, even when followed by a diastolic murmur. Occasionally, if the aortic valves are incompetent, hæmoptysis may occur. Sometimes pressure signs are present. There may be inequality in force of right and left carotid or radial pulses, but this is due to locally distributed aortitis at the site of exit of these vessels from the aorta. Of cardiac conditions which resemble aneurysm, those associated with mitral stenosis are of interest. Pressure signs may be caused by enlargement of the left auricle, such as paralysis of the left recurrent laryngeal nerve due, it is suggested, not to direct contact with the auricle but rather to the pushing up by the auricle of the pulmonary artery, and it is this structure which nips the nerve between it and the aorta. Two instructive cases of such paralysis are recorded. Less familiar pressure signs arising from the same cause are inequalities in the radial pulses; pressure upon the left bronchus; pupillary inequality; and, finally, even dysphagia. A screen examination of a case presenting the latter symptom showed diversion of the bismuth stream to the right at the level of the auricle, whilst there was delay at the level of the cricoid cartilage. Attention is also directed to the fact that hypertrophy of the conus arteriosus of the right ventricle may simulate aneurysm. Distinction in all these cases may be arrived at, we suppose, with some certainty if all the factors of the case be *taken into account*, but X rays furnish, by their power of excluding aneurysm in suspect cases, a powerful final corroborative factor.

EPIDEMIC ALOPECIA AREATA.

BALDNESS in its ordinary form has not been held to be a definite infective condition. Certainly no definite causative organism has been found. It has been suggested that alopecia areata is not *infective*, but there is some difference of opinion amongst dermatologists, and an epidemic of alopecia areata has been described by Haldin Davis in the *British Journal of Dermatology* (1914, xxvi., 207) which certainly suggests an infective origin in some cases. The epidemic broke out at an orphanage for girls, of whom there were 300, all under the age of 14. It was first noted in March, and in June there were 174 cases, amongst which were *two* foster-mothers and a servant-maid. The patches in the head resembled ringworm, but the author was emphatic that this was not the condition. The patches were not entirely bald; there were some stumps of hair which were swollen at the free end and which did not come out easily. The hairs which were left were found to break with difficulty (unlike ringworm), and within the hair, near the seat of fracture, was an opaque substance which was doubtless concerned in the condition and which was due to some infection, the organism of which, however, *could not be discovered*. There were no scurf and no parasites in the cases. The condition was suggested by the writer to be alopecia areata, but not of the ordinary type. The treatment adopted was vigorous and successful. The hair was washed with methylated spirit and soap, then an ointment was rubbed in consisting of beta-naphthol and sulphur. Massage of the head was given. In the severer cases a blistering fluid was applied, and in eight cases the scalp was shaved. By October all the cases were cured. In the following March a similar outbreak occurred. There were 30 cases. Hairs from 15 of these cases failed to show evidence of ringworm. In six weeks this second epidemic was ended.

THE BRITISH PHARMACEUTICAL CONFERENCE.

THE number and quality of the papers communicated at the fifty-first annual meeting of the British Pharmaceutical Conference, which was held at Chester this week, bear evidence of the continued usefulness of an *organisation* which has contributed largely to the advancement of pharmaceutical science during the last *half* century. The President's address consisted mainly of an epitome of the work that has been devoted in recent years to the study of the chemistry of plants and their products, and in view of the position held by Mr. E. H. Farr among workers in this domain his suggestion that problems of materia medica should be considered by a pharmaceutical committee representing the medical profession and pharmacy, and that the funds proceeding from the sale of the British Pharmacopœia should be devoted exclusively to defraying the expenses connected with its production, including the investigations required in that connexion, is worthy of respect. But it is a suggestion that connotes some financial compensation for the General Medical Council. Of the papers read at the Chester meeting several are of direct interest to medical practitioners, notably those which refer to anæsthetic ether and the prescribing of strychnine in combination with alkalies. Although not recognised by the British Pharmacopœia, anæsthetic ether is largely prepared from industrial methylated spirit, the high price of that made from rectified spirit having of late years been the cause of the increased use of the former. As a matter of fact, methylated ether is in use at all the large London hospitals, and a paper by the chief pharmacist at Guy's Hospital, in which the results of the scrutiny of a number of samples of methylated ether are stated, is therefore of especial interest, while it is satisfactory to know that anæsthetists can continue to use the cheaper product as a substitute for that manufactured from rectified spirit, which is subject to a high Excise duty. It seems clear from the communication on the incompatibility of solutions of strychnine with alkaline substances, that the limits within which these may be dispensed without fear of precipitation and consequent danger are by no means so wide as those within which preparations of nux vomica may be mixed with alkalies. These communications serve to show how pharmacy can assist medicine, and other papers furnish material which, indirectly at least, can be utilised to advantage in medical practice.

SIR Ronald Ross, K.C.V.O., F.R.S., will deliver the biennial Huxley lecture at the opening of the winter session at Charing Cross Hospital Medical School on Oct. 1st.

AT a meeting of the council held on July 16th Sir John Tweedy, F.R.C.S., late President of the Royal College of Surgeons of England, was elected President of the Medical Defence Union, *vice* Dr. Edgar G. Barnes, retired.

Sir StClair Thomson has been elected an Honorary Fellow of the American Laryngological Association. The American Laryngological Association is a select body, the number of Active Fellows being strictly limited, and the list of Honorary Fellows very restricted, up to the last meeting Chiari, of Vienna, Massei, of Naples, Moure, of Bordeaux, and Sir Felix Semon comprising the list.

THE Registrar of the General Medical Council has received a copy of a despatch from His Majesty's Consul-General at Rio de *Janeiro* stating the conditions under which persons holding foreign diplomas are permitted *to practise* medicine, surgery, and dentistry within the Federal District. This will be incorporated in the next edition of the pamphlet published by the Council giving the conditions under which persons qualified in their own country may practise abroad, and in the meantime the Registrar will be pleased to show the despatch to anyone who calls at the Council office, 299, Oxford-street, London, W.

IMPERIAL CANCER RESEARCH FUND.

The annual meeting of the supporters of the Imperial Cancer Research Fund took place on Tuesday, July 21st, at the Examination Hall, Queen-square, Bloomsbury, the Duke of Bedford presiding.

There were present among others Sir R. Douglas Powell, Sir Thomas Barlow, Sir Rickman J. Godlee, Sir William Church, Sir W. Watson Cheyne, Captain Sir John Shelley, Sir John Tweedy, Professor G. Sims Woodhead, Dr. F. W. Andrewes, Dr. John Tatham, Sir Frederic Eve, Dr. J. A. Ormerod, Dr. E. F. Bashford (general superintendent), Dr. J. A. Murray, Dr. W. E. Bullock, Dr. Sternberg, and Mr. F. G. Hallett (secretary).

Report of the Executive Committee.

The report of the executive committee was presented by Sir William Church. In this report Mr. F. G. Hallett, the secretary of the Fund, briefly summarised the proceedings of the year, mentioned the changes in the personnel of staff and workers, and enumerated the publications from the laboratories during the year. The details of the pathological and research work were given to the meeting in the report of Dr. E. F. Bashford, the general superintendent.

The Report of the General Superintendent.

Dr. Bashford's report mentioned first a diminution in the claims to "cure" cancer which had been brought to the notice of the Fund. He stated also as a result of many experiments during the year that "up to the present time, even in the laboratory, the only way in which rabbits, guinea-pigs, rats, and mice can be freed with certainty of transplanted and often of spontaneous tumour is by early removal." The number of experimental investigations has been decreased during the year as some of the tumour strains on propagation duplicated the behaviour of other strains. The experiments on heredity are being continued, and the biochemical investigations have been further developed during the year, while the observations on the specific properties of the tumour cells have gone to show how independent these cells are of influences proceeding from the environment, the etiological issues being thus further narrowed to alterations proceeding within the cell mechanism itself and not awakened by external factors.

Statistics.

With regard to the statistics of cancer the report said:—

The insistence in 1905 on a more detailed study of age-incidence has been completely justified and has rendered a further statistical report superfluous. Many new facts are revealed—e.g., it is confirmed that the rates of mortality for different organs at different ages are similar for the two sexes, while the separate organs vary widely among themselves, some showing a curve rising to a maximum only at the end of life, others a curve with a maximum earlier and followed by a fall to the end of life, and yet others two maxima at different age-periods. These peculiarities must be of the utmost importance in elucidating the nature of the disease.

The separate tabulation of deaths in institutions enables a comparison to be made between areas where institutions are common and where they are rare, and thus brings out the fact that they contribute to raise the number of deaths assigned to cancer. This separate tabulation also shows that no comparison between deaths in hospital and deaths outside is possible; such a comparison has, however, in the past often been used, and the increase in deaths from cancer in hospital statistics advanced as proof of a true increase of cancer in the population generally. The tabulation of deaths in institutions shows also that a higher proportion of males than females seek the aid of such institutions, and also that the ages at death are lower than in the general population. The explanation probably is that where the breadwinner is attacked resort to hospital becomes quickly more essential than when this is not the case.

As regards the increase in the number of deaths assigned to cancer, it is quite justifiable to make such a crude statement as that the number of deaths has increased in 1911 for females to 1088 per million living in 1911 as compared with 508 in 1860, and for males to 891 from 200 during the same period. It is also justifiable to express these facts in another way (also crudely)—namely, that of women attaining the age of 35, 1 in 12 was recorded as dying of cancer in 1889, but 1 in 7·4 in 1911, and of men 1 in 21 in 1889, but 1 in 9·7 in 1911. This latter statement also brings out more clearly how the male rate has been overtaking and approximating to the female. However, these figures ought not to be set out, as they still are, before the public without any qualification, and interpreted forthwith as a demonstration of the reality of the increase of cancer.

Both methods show the approximation of the male to the female death-rate and also raise the question of why the increase, if real, should affect one sex more than the other; but both lump all cases of cancer together, a proceeding which, if excusable in 1889 because nothing else was possible, is quite a misleading and erroneous thing to do to-day.

It is not proposed to refer in detail to the real or apparent increase of cancer, since modern statistical methods were applied by independent investigators to the new data at a recent meeting of the Epidemiological Section of the Royal Society of Medicine, when also the subject was fully discussed. Suffice it to say that the increase in the number of deaths is not uniform for the different parts of the body and, that for some parts, notably the uterus, an actual fall is persistently evident since 1902. For this organ diagnosis is relatively easy. Therefore, the number of cases treated probably approximates more closely than in other sites to the absolute number, and the effects of successful surgery are showing themselves in diminution of the deaths. For other parts of the body the increase may be apparent, for yet others real, although it is as yet impossible to decide. All the statements widely circulated in the newspapers as to the increase of cancer as a whole should be ignored, and attention only paid to those in which the different parts of the body are considered apart.

Cancer Areas and Cancer Houses.

In the concluding part of the report Dr. Bashford went thoroughly into the question of "cancer areas" and "cancer houses," pointing out that the determination of whether cancer is more frequent in certain houses is very much more complex than the simple arithmetic of enumeration.

"All the details of the population," he said, "not only of the 'cancer houses,' but also of the other houses in the same neighbourhood, must be known as regards numbers living in each house, sex, age, nature and site of the growth, duration of stay, occupation (environment and irritation), habits (alcohol, tobacco). Economic considerations must also be taken into account, since a house may be sought after by old people who have to content themselves with old or insanitary buildings because of the low rental, or a house may be let to couples without children, or may be frequented by aged lodgers. It has been shown above by experiment that hereditary influence cannot be summarily dismissed; further, the presence of other diseases cannot be ignored. The duration of stay is essential to determine whether the disease was acquired on the spot or brought from one district to another, but the long duration of the disease and the movements of population present peculiar difficulty to obtaining this information. The influence of occupation may overlap or be of more or less importance than habits such as indulgence in alcohol, tobacco, or diet. Very important will be the time relation between series of cases—viz., whether they succeed one another rapidly or are so distributed in time that this relationship has as little significance as the aggregation in families or in houses. Account must be taken of the fact that the frequency recorded to-day is very much greater than it was 50 years ago."

The report then gave details of an investigation conducted by Dr. Bashford into the well-known instances of cancer attacking certain houses and streets. The original examples brought forward by the late Dr. Law Webb having been shown to break down under analysis of the data, the report gave an account of visits paid by the superintendent to the different localities described respectively in 1898 and 1903 by Mr. D'Arcy Power as suggesting an endemic infection. It was difficult to recollect the evidence and test the statements, but the conclusion of the report was that the endemicity was not established. Mr. Power had already suspected that the age factor explained the apparent position, for in both village communities the higher ages were unduly in excess. Of the last case inquired into the report said:—

It has been deemed desirable to make an independent inquiry into a case which attracted widespread attention recently as the result of an address by Sir Thomas Oliver, published in THE LANCET of April 4th of this year, and widely commented upon in the lay press. He stated that his attention had been drawn to a short street in a small town in which between the 15 years 1893 and 1908 19 persons and one dog had died from cancer. In some of the houses two or three cases had occurred. Since in nearly all the patients there was no hereditary history of the disease, the large number of deaths among successive occupants suggested that the matter is more than a coincidence. Commenting on "cancer-houses" Sir Thomas Oliver wrote: "It is not an agreeable subject, and many medical men are of opinion that cancer germs lurk in houses."

The street referred to by Sir Thomas Oliver is in the town of Ayr. The attention of the Imperial Cancer Research Fund was drawn to it in 1908 as the result of a letter addressed by a lady to the late King Edward VII. The data obtainable in 1908 did not justify an investigation. The lady continued to make inquiries, and wrote to various Government departments in London and Scotland, as well as to prominent members of the medical profession, and in 1912 published an article in the *Ayrshire Post* entitled "Observations on Cancer Areas." This article was a memorandum she had submitted in 1908, amplified and modified as the result of her experience and inquiries. As the result of correspondence and an interview it appeared that the lady, whose mother had died from cancer, held strong views that cancer is an infective disease; that she had been called upon to investigate it; and that in her opinion the alleged frequency of cancer in the street referred to was due to its dissemination from paupers in the workhouse through the agency of mice and fleas, which came into houses in the winter time. Inquiries were made early in 1912 of the local authorities in Ayr, from which it appeared that they had inquired into the statements and did not agree with the importance attached to them. In consequence of Sir Thomas Oliver's address it seemed desirable to make an investigation on the spot, and a visit was made to Ayr, where every facility was given by the town clerk, the burgh medical officer, and the medical officer of health for the county. As a result the following facts set out in the table were obtained.

Reference to the table will show that it includes two duly authenticated cases of cancer not given in the lady's catalogue, and transfers three cases to the correct houses, including one to the opposite side of the street. Cancer as a cause of death is not upheld in at least 11 out of the 22 instances advanced. The dog is omitted in view of the fact that all the weight of scientific evidence is against the communication of cancer from one species to another, and also because no information could be obtained about it beyond the original assertion that it was a young dog, 4 years old. In the 11 cases in which nearer examination bears out the statement that death was due to cancer, the site alleged did not agree with that given on the death certificates, although for three of these five there is merely confusion between the primary and secondary site, and in the other two the vague statement of "bowel" is replaced by the accurate statement of "rectum" and "prostate." For a sixth case, where the site was not stated originally, a definite reference to "stomach" has been obtained. The comparison of the facts as actually found, with those on which Sir Thomas Oliver based his statements, is made in the table.

Table showing Death of and Cases of Tumours in Cancer Area, Ayr, from 1892–1912.

House.	Case.	Age.	Occupation.	Died.	Alleged site of cancer.	Certified cause of death.
A	1	64	Clergyman.	1894	Bowel.	Epithelioma of rectum.
	2	—	Maid. Operation.	1912	Stomach.	Still living.
B	3	65	Wife of manufacturer.	1893	Womb.	Cancer of uterus, 1 year.
C	4	86	Widow of doctor.	1897	Stomach.	Morbus cordis. Cardiac failure.
	5	80	Gent. No relation.	1903	Kidneys. Not verified.	Renal following upon with cystitis.
D	6	73	Retired.	1892	?	Cancer of stomach, 4 months.
	7	78	His wife.	1911	Breast.	Cancer of lung.
E	8	—	Lady feared to have cancer.	1912	Internal.	Still living, not ascertained.
	9	69	Hatter's wife.	1899	Not in list submitted.	Cancer of lung.
F	10	—	Lady.	1900	Breast.	Died in Glasgow.
G	11	71	Lady.	1896	Womb.	Cancer of stomach.
	12	80	Brother of above.	1893	Bowel.	Cerebral anæmia. Senile decay.
	13	—	Sister of above.	1903	,,	Not found.
	—	—	New people bought house.	1907	—	—
	14	—	Young lady. Operation.	1910	Breast.	Still living.
	15	84	Father of above.	1911	Stomach.	Cancer of stomach.
	16	71	Mother.	1912	—	Paralysis agitans. Carcinoma of left lung.
H	17	60	Wife of lawyer.	1895	Arm.	Scirrhus of mamma, 2 years.
	18	79	Lawyer.	1906	Bowel.	Malignant tumour of prostate gland.
	19	—	Daughter.	1908	Face.	Still living.
I	20	25	Lady.	1894	Womb.	Not found.
J	21	72	Wife of missionary.	1899	Breast.	Scirrhus of mamma.
K	22	49	Lady.	1899	—	Not found.
L	23	—	Dog, aged 4.	1909	—	,, ,,
	24	55	Chemist.	1900	Not in list submitted.	Malignant disease of tongue (6 months) and sublingual and pharyngeal glands (2 months.

In three out of the six houses the occurrence of one death was confirmed; in only one out of four houses the claim of two deaths was confirmed; for one house for which three deaths were claimed only two were confirmed, and for another house for which six deaths were claimed, three were confirmed. In the first house with two verified deaths the first death occurred in 1892 and the second in 1911, after an interval of 19 years; in the second house with two verified deaths the first death occurred in 1895 and the second in 1906, or after 11 years; in the only house with three cases the first death occurred in 1896, the second in 1911 (or 15 years later), and the third one year after the second. When the cases are considered as they occurred from year to year, for the years 1892 to 1898, there was one death each year. 1899 and 1900 each had two deaths. The years 1901 to 1906 showed no deaths. 1907 to 1910 each showed one death. 1911 and 1912 had two deaths, and in 1913 and up to the present date there has been no death.

Since wide publicity has been authoritatively obtained for the statements of a cancer street in Ayr, it may be mere justice to point out the true significance of the facts.

The street referred to is broad and contains the best type of residential detached and semi-detached villas with gardens front and back. It runs east and west, so that the fronts of the houses on one side of the street and the backs of the houses on the other side of the road face south. Hence, there is no excuse for attaching significance to the south side as "the shady side" in the way that has been done. On the south side there are 23 houses, on the north side 18, and all the houses are occupied. The householders are mostly retired business men or belong to one of the professions; several are widows. The average age is therefore higher than in other parts of the town. A glance at the table giving the details of the cases claimed as cancer shows the youngest aged 25 and 49 were not confirmed. The age of the youngest verified case is 55, and four alleged cases are aged 80 or above, although only one could be verified. In view of the very small numbers—13 persons in all—it is not advisable to attempt an age and sex distribution; the facts may therefore be stated crudely in the absence of exact information as to the age and sex of each of the inhabitants of the street. The total number of houses is 41, in six of these cancer had occurred over a period of 21 years, there being intervals of 19, 11, and 15 years between the first and second cases in each of three houses, and in the third house a possible third case occurred one year after the second. The total population of the street is 246, or an average of six persons per house. For 21 years this gives a population of 5166 with 13 deaths, or a crude death-rate of 2·5 per 1000. The total deaths in Ayr in 1913 were 44, or 1·3 per 1000. The death-rate for Scotland in 1911 at the age of 45 is 2·04 per 1000, and inquiries on the spot show that 45 is not an under-estimate of the age of the population in the street.

The higher recorded incidence in this street is explained partly by the high age of its inhabitants as contrasted with other areas inhabited by factory hands and miners with young children. The coincidences and accidents inseparable from a disease of such frequency suffice to minimise the significance of the numbers recorded, and by the fact that cancer is more than ten times as frequent at 70 as it is at 30 or 35 years of age.

As sanitation and water have also been incriminated, it may be pointed out that under a very enlightened municipality, the Burgh of Ayr in recent years has entirely rebuilt the whole drainage of the town at a cost of some £120,000, making it as perfect as sea drainage can be. Further, over 800 more or less insanitary buildings have been removed, and all this in a small seaside and residential town of less than 34,000 inhabitants.

The history of how the idea of a "cancer street" originated and became current in the town of Ayr is as interesting and instructive as the manner in which in the course of a few years it acquired the standing of a scientific statement of fact, publication in a leading medical journal, and consequently widespread currency in the lay press as a duly authenticated instance of "cancer houses."

THE TREASURER'S REPORT.

The report of the honorary treasurer, Sir W. Watson Cheyne, for the year ending June 24th, 1914, was a fairly satisfactory one. Unlike last year, he was unable to report any increase in the total receipts for the researches. He said:—

> For the first year since 1896 we have received no legacy except a small balance of less than £2 from a legacy received in a previous year, but the receipts again include the sum of £500 which has been paid in advance by Mrs. Streatfield as part of a promised legacy of £2000. This being the second amount of £500 kindly contributed by her under the conditions of the original scheme, Mrs. Streatfield now becomes a member of the general committee.
>
> The total number who have subscribed to the Fund during the year is 146, as compared with 137 in 1913, but whereas the number of small contributions has increased, those of higher amounts have somewhat declined. It is due to the personal efforts of our President in appealing for new subscribers that there is this increase in the number of subscriptions. On the general principle that legacies may be averaged over a period of years, it is to be hoped that during next year the income from this source will be increased.
>
> The expenditure, including all items, amounted to £6491 6s. 9d., being rather less than last year, but as in last year's account an item of £622 appeared for expenditure on fittings, the general working expenditure this year must be said to have increased by about £358. In this sum, however, is included the salary of an additional assistant, Dr. Bullock, who took up his duties in August.
>
> Every care has been taken during the year to safeguard the expenditure, whilst at the same time all the requirements of the general superintendent in regard to the necessities of research have been met.
>
> The total expenditure has exceeded the fixed income of the fund from investments by £1444 18s. 9d.

THE RESOLUTIONS OF THE MEETING.

The adoption of the report was moved by Sir WILLIAM CHURCH, seconded by Professor SIMS WOODHEAD, and carried unanimously.

Sir RICHARD DOUGLAS POWELL moved, and Sir JOHN TWEEDY seconded, a vote of thanks to the executive committee, sub-committees, and treasurer of the fund. This was carried unanimously.

Sir W. WATSON CHEYNE proposed a vote of thanks to the Duke of Bedford, president of the fund, which was seconded by Sir FREDERIC EVE, and carried unanimously.

The Duke of BEDFORD, in a brief reply, referred to the magnificent services rendered to public health by Mr. Joseph Chamberlain.

MEDICINE AND THE LAW.

A Question of Liability.

IN the Blackpool county court his honour Judge Sturges tried an action recently in which Mr. F. C. Sprawson sued Mr. T. Firth, a theatrical manager, for £17 6s. 6d. as fees in connexion with an operation which he had performed upon the defendant's wife. The defendant alleged that he was not liable to Mr. Sprawson but to Dr. John Stewart, the patient's medical attendant, upon whose advice Mr. Sprawson had been consulted and had operated. The defendant had, in fact, after the proceedings were commenced, made payments to Dr. Stewart, and a sum of £10 had been handed to Mr. Sprawson and had been paid into court. The defendant in support of his case produced an account from Dr. Stewart for £35, which purported to include the plaintiff's fees. Dr. Stewart in evidence said that he had received two sums of £10 on account, the second of which he had handed to the plaintiff. He denied that he was liable for Mr. Sprawson's fees, or that it was customary for a medical man who advised that a surgeon should be called in to be so liable. Mr. Sprawson said that he had booked the debt to the defendant and not to Dr. Stewart. He had given no authority to Dr. Stewart to collect his fees, and not having done so should not look to him for payment. He had never followed such a course with regard to medical men for whom he performed operations, and it was not customary to do so. For the plaintiff it was argued that in the absence of any authority given by him to Dr. Stewart the plaintiff's position was not affected by Dr. Stewart's act in sending an inclusive account for fees. His honour held that he would take the document produced into account in deciding the case, and he was of the opinion that this being so the defendant's position in looking upon Dr. Stewart as the person to whom the money was to be paid was correct. He was further of the opinion from his own knowledge that there was no certainty of custom such as the plaintiff and Dr. Stewart alleged. He therefore gave judgment for the defendant. It was intimated that there might be an appeal.

A Sham Medical Practitioner Convicted.

t the recent Hants assizes a person whose ne was given as Hugh Munro McLeod Mackenzie ; convicted upon an indictment charging him h giving certificates of the cause of death hout being entitled to do so. The prisoner was ed to possess no medical degree, but to have at time studied medicine at Edinburgh. He ended to his signature on the certificates the ers B.M., L.R.C.S., L.R.C.P., and the court was ormed that a medical man bearing the names en above and now practising in South Africa ; the possessor of the degrees indicated. The soner had practised in Portsmouth in 1910, but question of his qualification had been raised l he had moved to Southampton, where the ences charged had been committed, and where had been placed on the panel under the urance Act. Mr. Justice Ridley took into coneration the ill health of the prisoner, and tenced him to be imprisoned for one month.

Unqualified Person Pretending to Treat Cancer.

At Altrincham recently an inquest was held upon body of a woman, 70 years of age, who had fered from cancer of the breast, for which she l been attended by Mr. H. Lund and Mr. J. R. lson, but who had since submitted herself to a n named Clay living at Hebden Bridge. This son gave evidence that he had during past year "removed five nodules, and that ere was a very diminished one left." Into at he injected a solution which he was in habit of using, after which the woman nted. He spoke of having his "limitations," d said his treatment applied to "external cancer" ly, an "internal development" being beyond his ach. The coroner asked him, "How did you know at the cancer was not internal?" and he replied at he did not know. Mr. Wilson gave evidence at death was partly due to cancer, and might ssibly have been hastened by shock and acute llulitis of the tissues. He had no doubt that the ock from the cellulitis was a contributory cause death. In any case the woman would probably ve died from carcinoma of the breast. The jury id that they felt a "strong suspicion" that ath was largely attributable to Clay's treatent, but found, as they had been advised by e coroner, a verdict in accordance with the edical evidence, adding "We think Mr. Clay deserving of censure and that his profession relieve, if not absolutely to cure, cancer is a very ngerous proceeding." The coroner appears to ave then exhorted Clay to desist from professing cure cancer, his observations ending with the ords "Oh, Mr. Clay, a great responsibility rests pon you, and I do ask you not to do it." Whether e coroner's words, which hardly seem to answer e description of "censure," or the possibility of verdict of manslaughter ensuing upon another ccasion, will deter Mr. Clay remains to be seen. he latter contingency is the one which Mr. Clay ould be well advised to consider.

Death under an Anæsthetic and a Difficult Question.

An inquest held recently at the Dorset County Iospital showed how difficult a question may have o be decided by a surgeon called upon to operate n a case where the death of the patient under the peration is likely to ensue and to entail an nquest, and where in the absence of an operation continued suffering for the patient is certain and death, more or less immediate, is at least equally probable. The deceased, C. J. Russell, was a carpenter, 65 years of age, a stout man, well known to the police and the Poor-law authorities where he lived as a heavy drinker for 20 years. He was sent to the hospital from the workhouse suffering from strangulated hernia, which was relieved by treatment, but the patient was very desirous of an operation, as he suffered frequently and considerably. Mr. W. B. Cosens, the surgeon who ultimately decided to operate, had known the man and been aware of his habits for many years, and was very unwilling to operate owing to the obvious danger due to the patient's condition, but was equally of the opinion, as he informed the jury, that if the man left the hospital and had a bout of intoxication strangulation would again take place, with the probable necessity for immediate operation in hopeless circumstances. Accordingly Russell was put to bed for 17 days and every possible preparation made to meet the danger which the administration of the anæsthetic would entail. It was given by the house surgeon, whose qualification and experience for the task were proved by Mr. Cosens, but before the man was thoroughly under its influence dangerous symptoms were observed, breathing eventually ceasing, and in spite of everything that could be done the patient died. The coroner placed the matter fairly before the jury, pointing out that the risk was recognised by the surgeon, but that he acceded to the patient's request for an operation, hoping that he might be able to relieve him from pain. The jury, a member of which showed by an observation that he, too, knew the deceased and his habits, returned a verdict in accordance with the evidence, that "the deceased came by his death through failure of the heart, such failure occurring while the said Charles Russell was under the effect of an anæsthetic properly administered, preparatory to an operation for strangulated hernia."

MEDICO-PSYCHOLOGICAL ASSOCIATION OF GREAT BRITAIN AND IRELAND.

THE annual meeting of this association was held on July 14th and 15th. During the early part of the meetings Dr. JAMES CHAMBERS, the President, occupied the chair.

Dr. T. B. HYSLOP, the chairman of the committee appointed in connexion with the Mental Deficiency Bill, presented a report which showed that the committee had been concerned with the Elementary Education (Defective and Epileptic Children) Amendment Bill and in the provisional regulations in pursuance of the Mental Deficiency Act. It was hoped that the Mental Deficiency Act Regulations, which came into force in April, would be simplified when re-issued. Several recommendations were made in the report. The Central Association for the Care of the Mentally Defective took the necessary steps to register itself as an incorporated association, and a memorandum of association had been drawn up for submission to the Board of Trade. The composition of the future council had been postponed until next year. Following upon a short discussion, Dr. Hyslop said that difficulties were likely to arise, unless care was taken, from persons with no knowledge of mental conditions seeking to define the borderline between insanity and mental deficiency on the one hand, and on the other between mental deficiency and health. It was for the association to take a definite stand on this point and present a guiding memorandum.

The report was approved, and the committee reappointed to continue its work. The President (Dr. Thomson) and Dr. Bedford Pierce (chairman of the status committee) were appointed to act with the subcommittee of the Board of Control. The consideration of the report of the committee *re* the status of British psychiatry and of medical officers was deferred until the following day.

Dr. Chambers, who now retired from the presidency, and the other officers of the association were heartily thanked for their services during the year now ending.

Dr. CHAMBERS then introduced the new President, Dr. David G. Thomson, superintendent of the Norfolk County Asylum.

Dr. THOMSON acknowledged the honour conferred upon him, and announced that the association's divisional prizes had been awarded to Dr. Eager and Dr. Macphail, and the bronze medal to Mr. J. C. Wootton. He then delivered his presidential address, which consisted of a review of the legal and medical arrangements for dealing with the insane during the past hundred years, "a period," he said, "which is given point to by the fact that this is the centenary year of the establishment of the Norfolk County Asylum, the oldest county institution of its kind in the country. Hence the stages in the evolution of treatment of mental alienation find illustration within these walls." Dr. Thomson then traced the origin and progress of the laws relating to the insane. The first legislation in favour of the insane poor was, he said, "Wynne's Act," enacted in 1808, which enabled each county to build and equip institutions out of the county funds, so that parishes on a weekly *per capita* payment could send insane poor to the county institution instead of to gaols, houses of correction or industry, but only a few counties used this permissive power—namely, Nottinghamshire, Norfolk, Lancashire, Yorkshire, and Staffordshire. A special committee of the House of Commons in 1815 took evidence as to the deplorable state of the insane in privately owned madhouses, and even in a few public asylums, and Dr. Thomson gave some lurid specimens of this evidence. The committee's report resulted in an Amending Act, which sought to "enforce" the provisions of the Act of 1808. "But it was not," he said, "until the early years of the reign of Victoria—namely, in 1845—that the Act was passed which has been styled the 'Magna Charta of the Insane,' as it gave them for the first time full legal protection and supervision. Other beneficent forces were also by this time at work, for Dr. Gardiner Hill, of Lincoln Asylum, had begun a great campaign against the use of restraint. His strenuous contention that chains and manacles and other coercive measures were unnecessary and harmful led people to declare that he was himself insane, but his views ultimately prevailed, and for many years mechanical restraint has been abolished, except in occasional instances for surgical reasons. 1841 saw the foundation of the Medico-Psychological Association by a few doctors concerned with the study of insanity, its etiology, prevention, and treatment. The chained lunatic now became a patient. County and borough asylums came into being all over the kingdom, private asylums for the well-to-do put their houses in order, and every institution for the insane was put under the control of the Commissioners in Lunacy. Gradually the view that insanity was a possession of the devil or a metaphysical manifestation not amenable to medicine gave place to the conviction that it had a physical basis like other affections, and this altered view has resulted in great advance of knowledge, for alienists have not been slow to apply the great advances in general medicine to this specialty." Dr. Thomson then alluded to the more recent work of the Medico-Psychological Association, the system of training, certification, and registration of mental nurses; the adoption by six Universities of its recommendations of special post-graduate training and diplomas in psychiatry, on lines similar to those in public health and tropical medicine. "If the association," he said, "had done nothing beside provide better doctors and nurses for mental disorders, its existence would have been justified and its labours gratefully acknowledged by the public." Among the topics more particularly dealt with in this section of the presidential address were the following: the disabilities of asylum medical service and the resulting dearth of candidates; the absence of provision for early incipient forms of mental disorder without the dreaded legal certification and committal to the insane wards of workhouses and asylums; the absence of properly equipped clinics for this purpose for the ante- and post-graduate training of young men in psychiatry; the Mental Deficiency Act; the Elementary Education (Defective and Epileptic Children) Bill; and the unsatisfactory state of the law with regard to crimes committed by insane persons. The address was received with marked favour.

A paper on Intrathecal Treatment of General Paralysis was contributed by Dr. E. MAPOTHER and Dr. E. BEATON, who described the technique which they adopted and discussed whether anatomical inaccessibility of the spirochæta constituted, by itself, a complete explanation of the refractory character of the disease to treatment.

On Wednesday, July 15th, a paper was read on the Detection of a Dysentery Carrier, by Mr. H. SALTER GETTINGS and Dr. ETHEL WALDRON (of Wakefield Asylum). The dysentery bacillus was discovered in the loose stools of a patient who displayed no other symptoms; there had been no blood or slime, and no rise of temperature. There had been one or more cases in her ward for four years, and soon after her transfer to another ward there was a fatal case of the disease. Since 1913 there had been in the asylum 14 cases with five deaths. The bacillus was only found after a patient hunt.

Dr. A. W. DANIEL read a paper on the Undesirable Results Arising from Continued Use of Scopolamine Hydrobromine or Hyoscine. He gave an account of the symptoms, both physical and mental, which followed the administration of the drug. There was great excitement, with visions of members of the patient's family undergoing torture, progressive weakness of legs and arms, and rapid and progressive wasting, so that the loss of weight became serious. Imbeciles showed marked intolerance to the drug, and in any patient repeated injection should be avoided. Morally, the patients having the drug became very untrustworthy and sometimes were suicidal. Withdrawal of the drug, which was the only cure for the symptoms, brought about a speedy improvement and restoration of the body weight.

The association then proceeded to discuss, and for the most part to approve, the Report of the Committee on the Status of British Psychiatry and of Medical Officers of asylums. The report contained the following resolutions:—

> That it is desirable that provision be made for the detention of patients in psychiatric clinics for a limited time without certification.
>
> That it is desirable that any form of detention under modified conditions, such as proposed in the Lunacy Bill of the year 1905, should not be confined to private houses, but should be extended to all institutions for the insane and clinics duly approved for the purpose.
>
> That it is desirable that the provision already made for the reception of voluntary boarders into licensed houses and registered hospitals be extended to public asylums and psychiatric clinics.
>
> That the psychiatric clinics be for the reception and treatment of voluntary boarders and notified persons.
>
> That it is desirable that patients be admitted to county asylums direct from their homes without being of necessity taken to the Poor-law institutions—in this way making better use of the existing hospital accommodation at these asylums.
>
> That urgency orders be made to apply to Poor-law cases.
>
> That it is desirable that neighbouring asylums be enabled to establish and maintain joint laboratories.
>
> That it is desirable that a standing committee of the association be formed to be called the "research committee," and to have as its object the encouragement and guidance of original work in psychiatry.

It was agreed to forward copies of the report to the Home Secretary, the President of the Local Government Board, the members of the Board of Control, the chairmen and clerks of asylum boards and visiting committees, and the corresponding officials in Scotland and Ireland, and other persons interested in the subject, at the discretion of the President of the association.

ROYAL COMMISSION ON VENEREAL DISEASES.

AT the forty-sixth meeting of the Royal Commission on Venereal Diseases evidence was given by Dr. Svond Lomholt, surgeon at the Municipal Hospital at Copenhagen, regarding the methods adopted for dealing with venereal diseases in Denmark. The principle has been to provide free treatment and to render it as easily accessible as possible. As early as 1773 a rescript provided for free treatment of all poor persons suffering from venereal diseases in one of the provinces of Denmark, and similar regulations were made from time to time until by an Act of 1874 it was laid down that every person should be entitled to free treatment for venereal disease without regard to his ability to pay. In reality little was done to make this right to free treatment of practical value until 1906, when an Act was passed which contained a provision compelling the municipalities to arrange easy access for free consultation and treatment for all persons suffering from venereal disease. Since that date, especially in Copenhagen, in which town probably 80 per cent. of the disease occurring in the country is to be found, a great deal has been done. Very complete hospital facilities have been provided, and in addition there are three public consulting-rooms for contagious and venereal diseases, at one of which evening consultations are held. Twelve municipal doctors (two of whom are women) have also been appointed for the purpose of giving free treatment of venereal diseases. The experience has been that patients have shown themselves very ready to take advantage of these facilities. In some directions compulsory measures have been adopted. A doctor treating a case of venereal disease is required to point out all the consequences of the disease, and there is also provision for securing that persons suffering from venereal disease shall continue their treatment. Dr. Lomholt thought that this latter provision had been very useful. A system of confidential notification of venereal diseases is in force. The names and addresses of the patients are not notified, and the cases are identified only by numbers, and the notification is consequently only of use for statistical purposes. Dr. Lomholt has made a critical examination of the published figures, and showed that they could only be accepted with a good deal of reserve.

Mr. Charters J. Symonds, consulting surgeon at Guy's Hospital, giving evidence, laid stress on the need for largely increasing the means available for treating venereal diseases. He thought that existing institutions should be utilised as far as possible, and that these, together with any additional provision which might be made, should be linked up with Insurance Committee areas and with panel doctors. Evening clinics should be provided at every centre. It would be necessary that a scheme of this kind should receive adequate subsidies from the State. Mr. Symonds advocated the formation of a National Society which should supervise the selection of lecturers, the scope of teaching, and the publication of books and pamphlets, with a view to the education of the public respecting venereal disease. Such a society, he thought, should be voluntary and should be ready to assist the Government in any measure of which the Government approved. He would propose that the Royal Society of Medicine should nominate persons to serve as a committee of this national society, and that a definite sum of public money should be placed in the hands of that committee. With regard to the question of notification, Mr. Symonds said that the experience of other countries showed that in the present state of mind of the people notification was ineffective; it led to greater concealment of disease and tended to drive sufferers to quacks' treatment. He thought there could be little doubt that notification would help towards suppression of disease, but it was necessary to wait until people had become educated in the matter; the demand for notification and international action might then come from the great mass of the population of this and other countries.

Mr. Arthur J. Evans, honorary surgeon to the Liverpool Stanley Hospital, was of opinion that if better facilities for treating venereal diseases could be provided at the general hospitals the spread of the infection would be reduced. The establishment of such a clinic to a hospital should, he thought, be financed and controlled by the State and not by the representative of the charitable public. Mr. Evans stated that in his capacity as visiting surgeon to the Brownlow Hill Poor-law Infirmary a very large number of venereal cases were brought to his notice. He thought that in Poor-law patients the general percentage of the later manifestations was very high. In the male sex this was exceedingly striking, and in a larger number of cases permanent incapability of earning a livelihood was produced; many also were beyond any hope of benefit even by modern treatment. A great difficulty in regard to Poor-law patients arose from the fact that there was no law to compel these patients to remain till properly cured; patients frequently left the hospital while still in an infectious state. As medical adviser to an important shipping company, Mr. Evans said that it was his experience that a great deal of venereal disease was introduced from abroad, and it was his opinion that this continuous introduction of disease into this country should undoubtedly be brought under control. He recommended that the Board of Trade should take steps to warn and explain to seamen and others dangers of contracting venereal disease, and the danger of infecting others of the community. The importation of disease would, he thought, be greatly lessened if sailors were aware of the risks encountered in foreign ports, and especially in the tropics.

JUNE AT HOME AND ABROAD.

At Home.

JUNE, although subject to sudden lapses into a chilly spring temperature, after violent local thunderstorms, was one of the brightest months on record, and was also generally dry, when the total amount of rainfall is considered, while the hot and cold spells so counterbalanced each other that the mean temperature for the whole month differed very little from the average. In London, at all events in the southern and south-western districts, the chief meteorological event was the violent and fatal thunderstorm that occurred on Sunday, the 14th. During its passage certain localities had more than a month's rainfall within three hours, while others had a mere sprinkle. The heaviest falls were at Wandsworth, Wimbledon, and Richmond. In Richmond Park Sir Frederick Treves measured as much as 3·7 in., and this appears to be the greatest quantity at any given spot. At the Kew Observatory the amount was only 1·3 in., and the aggregate for the month, 1·96 in., was 0·29 in. less than the normal. The Kew temperature, which was rather low during the earlier days of the month, became very high after the middle and again towards the end, and the mean maximum equalled 69°, against an average of 68°, while the mean minimum of 51° was identical with the normal. None of the night readings were very low and none oppressively high. The highest afternoon maximum occurred on the 30th, the figure being 84°, and the lowest, only 56°, was recorded on the 8th. Every day but the 6th brought its share of sunshine, and the total number of hours was no less than 256, which represents rather more than two hours per day above the normal. The more central districts of London were also very sunny; at South Kensington the figure was as high as 258 hours. On the south coast the records were naturally higher; at Brighton and also at Ventnor the total was 280 hours. The Midlands, as represented by Bath and Nottingham, had a temperature about the same as Kew, but at Harrogate and Buxton the readings were a few degrees lower, the mean maximum being 64° and the mean minimum 47° at both resorts. Neither Bath nor Nottingham was so bright as London, but their sunshine was greatly in excess of the average. Some of the great cities of the north recorded as much as the more southern districts do during an average June. At Glasgow there were 190 hours, and at Manchester 192 hours. On certain parts of the south-west coast the temperature was lowered by sea fogs, and the same phenomenon seriously interrupted the sun's record. At Newquay and the Scilly Isles the sunshine was no more than 207 hours, but at Torquay it was as high as 261 hours. Torquay had a mean maximum temperature a degree lower than Kew, and a mean minimum 2° higher. At the Scilly Isles the corresponding figures were 61° and 53°. Over the south and south-west of England generally the weather was too dry. In some parts of Hampshire and Dorset the total rainfall was less than half an inch, and at Torquay it barely exceeded three-quarters of an inch. The Channel Isles were also very dry; at Jersey the rainfall was rather less than half an inch against an average of 2·09 in. Sea fog also intercepted much of the sunshine, with the result that Jersey's total was below the normal by 14 hours, the aggregate figure being 225 hours.

Abroad.

The weather on the continent was generally dry and fine, but the rain, when it did occur, was often heavier than in this country. At Paris the total fall was 2·7 in., while in many other parts of France, where thunderstorms were rife, it was larger. At Biarritz it amounted to 6·8 in. Paris had more hot days than London, and the mean maximum temperature was 71°. The mean minimum, however, was the same as at Kew. Brussels had the same mean afternoon warmth as Kew, while at night the temperature was 2° lower. The relatively low minimum was due to some very cold nights early in the month. In spite of some outbursts of great heat in Germany the mean maximum temperature at Berlin was no higher than at Paris, although the mean minimum was 3° above that at the French capital. Only 10 or 11 days were at all rainy, but the aggregate fall was rather large, amounting to more than 3 in. The west and south-west of France underwent some great changes in temperature. From time to time the shaded thermometer nearly touched 100°, but as a whole the month was not particularly warm. At Biarritz, where the temperature was 91° on the 3rd, the average maximum was no higher than at Kew. On as many as five days there was no greater heat than 59°. The nights were with very few exceptions warm, and the mean minimum was as high as 55°.

The most sudden change of temperature of the month, which came on the 8th or 9th, was much less felt on the continent than in this country, where a strong northerly wind, reaching the velocity of a gale over a considerable area, sent the thermometer down to the level of early spring for a time. As a whole there was little wind, and the general movement was from some point between west and north rather than from between south and west, such as occurs during an average June.

VITAL STATISTICS.

HEALTH OF ENGLISH TOWNS.

IN the 97 English and Welsh towns with populations exceeding 50,000 persons at the last Census and whose aggregate population at the middle of this year is estimated at 18,120,059 persons, 8744 births and 4018 deaths were registered during the week ended Saturday, July 18th. The annual rate of mortality in these towns, which had been 12·1, 12·7, and 11·5 per 1000 in the three preceding weeks, slightly rose to 11·6 per 1000 in the week under notice. During the 13 weeks of last quarter the mean annual death-rate in these towns averaged 13·8, against 13·1 per 1000 in London during the same period. Among the several towns the death-rate last week ranged from 3·7 in Ealing, 4·6 in Walthamstow, 4·9 in Devonport, 5·2 in Ilford, and 5·6 in Eastbourne; to 16·9 in South Shields, 17·2 in Preston, 17·7 in Middlesbrough, 20·1 in Blackpool, and 23·5 in Bootle.

The 4018 deaths from all causes were 18 in excess of the number in the previous week, and included 405 which were referred to the principal epidemic diseases, against 444 and 394 in the two preceding weeks. Of these 406 deaths, 151 resulted from infantile diarrhœal diseases, 110 from measles, 73 from whooping-cough, 34 from diphtheria, 26 from scarlet fever, and 12 from enteric fever, but not one from small-pox. The mean annual death-rate from these diseases was equal to 1·2 per 1000, and was 0·1 more than the rate in the previous week. The deaths of infants (under 2 years) attributed to diarrhœa and enteritis, which had been 79, 116, and 112 in the three preceding weeks, rose to 151 last week; of this number 38 were registered in London, 11 in Sheffield, 10 in Birmingham, 7 in Birkenhead, 7 in Leeds, 6 in Liverpool, 5 in Manchester, and 4 each in Walsall, Bootle, and Newcastle-on-Tyne. The deaths referred to measles, which had been 144, 130, and 139 in the three preceding weeks, fell to 110 last week, and included 35 in London, 21 in Liverpool, 12 in Manchester, 7 in Sheffield, 7 in Leeds, and 3 each in Birmingham, Oldham, and Newport (Mon.) The fatal cases of whooping-cough, which had been 93, 95, and 77 in the three preceding weeks, further declined to 73 last week, of which 19 occurred in London, 9 in Liverpool, 3 in Bradford, and 3 in Leeds. The deaths attributed to diphtheria, which had been 35, 64, and 30 in the three preceding weeks, rose to 34 last week, and included 11 in London, 4 in Birmingham, 3 in Liverpool, 2 in Bournemouth, and 2 in Manchester. The deaths referred to scarlet fever, which had been 30, 23, and 22 in the three preceding weeks, rose to 26 last week; of which 5 were recorded in Manchester, 4 in Sheffield, 3 in Salford, 2 in Liverpool, and 2 in Sunderland. The fatal cases of enteric fever, which had been 13, 16, and 13 in the three preceding weeks, were 12 last week, and included 4 in London.

The number of scarlet fever patients under treatment in the Metropolitan Asylums Hospitals and the London Fever Hospital, which had steadily increased from 2862 to 3109 in the nine preceding weeks, further rose to 3126 on Saturday last; 430 new cases were admitted during the week, against 440, 442, and 414 in the three preceding weeks. These hospitals also contained on Saturday last 1059 cases of diphtheria, 230 of whooping-cough, 33 of measles, and 33 of enteric fever, but not one of small-pox. The 1021 deaths from all causes in London were 101 in excess of the number in the previous week, and corresponded to an annual death-rate of 11·8 per 1000. The deaths referred to diseases of the respiratory system, which had declined from 163 to 111 in the four preceding weeks, rose to 128 in the week under notice, but were 9 below the number in the corresponding week of last year.

Of the 4018 deaths from all causes in the 97 towns, 172 resulted from different forms of violence and 317 were the subject of coroners' inquests, while 1288 occurred in public institutions. The causes of 44, or 1·1 per cent., of the total deaths were not certified either by a registered medical practitioner or by a coroner after inquest. All the causes of death were duly certified in London and in its 14 suburban districts, in Sheffield, Leeds, Bristol, Bradford, Newcastle-on-Tyne, and in 58 other smaller towns. Of the 44 uncertified causes of death, 12 were registered in Birmingham, 8 in Liverpool, 3 in Gloucester, and 2 each in Bootle, Warrington, Preston, Hull, and Tynemouth.

HEALTH OF SCOTCH TOWNS.

In the 16 largest Scotch towns with an aggregate population estimated at 2,293,200 persons at the middle of this year, 1216 births and 559 deaths were registered during the week ended Saturday, July 18th. The annual rate of mortality in these towns, which had been 13·8, 14·1, and 13·6 per 1000 in the three preceding weeks, further declined to 12·7 per 1000 in the week under notice. During the 13 weeks of last quarter the mean annual death-rate in these towns averaged 15·5, against a corresponding rate of 13·8 per 1000 in the 97 large English towns. Among the several towns the death-rate ranged from 10·3 in Kilmarnock, 10·9 in Dundee and in Paisley, and 11·2 in Edinburgh, to 17·0 in Coatbridge, 18·4 in Perth, and 18·9 in Hamilton.

The 559 deaths from all causes were 38 fewer than the number in the previous week, and included 58 which were referred to the principal epidemic diseases, against numbers declining from 67 to 41 in the four preceding weeks. Of these 58 deaths, 18 resulted from infantile diarrhœal diseases, 15 from whooping-cough, 12 from measles, 7 from scarlet fever, 4 from diphtheria, and 2 from enteric fever, but not one from small-pox. The mean annual death-rate from these diseases was equal to 1·3, against 1·2 per 1000 in the 97 large English towns. The deaths of infants (under 2 years) attributed to diarrhœa and enteritis, which had been 10, 13, and 10 in the three preceding weeks, rose to 18 last week, of which 11 were registered in Glasgow, 2 in Dundee, and 2 in Aberdeen. The deaths referred to whooping-cough, which had been 18, 12, and 13 in the three preceding weeks, rose to 15 last week, and included 11 in Glasgow and 2 in Falkirk. The fatal cases of measles, which had been 7, 9, and 10 in the three preceding weeks, further increased to 12 last week; 5 deaths occurred in Dundee, 2 in Glasgow, and 2 in Hamilton. The deaths attributed to scarlet fever, which had been 7, 1, and 3 in the three preceding weeks, rose to 7 last week, but showed no excess in any particular town. The 4 deaths referred to diphtheria, of which 2 were recorded in Glasgow, were equal to the average in the three preceding weeks. The fatal cases of enteric fever were registered in Glasgow and Edinburgh.

The deaths referred to diseases of the respiratory system, which had steadily declined from 99 to 61 in the six preceding weeks, further fell to 51 in the week under notice; 21 deaths resulted from various forms of violence, against 33 and 26 in the two preceding weeks.

HEALTH OF IRISH TOWNS.

In the 27 town districts of Ireland, with an aggregate population estimated at 1,205,280 persons at the middle of this year, 574 births and 371 deaths were registered during the week ended Saturday, July 18th. The annual rate of mortality in these towns, which had been 15·7, 16·2, and 15·9 per 1000 in the three preceding weeks, rose to 16·1 per 1000 in the week under notice. During the 13 weeks of last quarter the mean annual death-rate in these towns averaged 19·0 per 1000; in the 97 large English towns the corresponding rate did not exceed 13·8, while in the 16 Scottish towns it was equal to 15·5 per 1000. The annual death-rate last week was equal to 17·2 in Dublin (against 11·8 in London and 12·8 in Glasgow), 13·5 in Belfast, 14·3 in Cork, 22·8 in Londonderry, 19·0 in Limerick, and 24·7 in Waterford, while in the 21 smaller towns the mean rate did not exceed 16·4 per 1000.

The 371 deaths from all causes were 3 in excess of the number in the previous week, and included 43 which were referred to the principal epidemic diseases, against 47 and 38 in the two preceding weeks. Of these 43 deaths, 14 resulted from measles, 14 from infantile diarrhœal diseases, 6 from whooping-cough, 5 from scarlet fever, 2 from diphtheria, and 2 from enteric fever, but not one from small-pox. The mean annual death-rate from these diseases last week was equal to 1·9, against corresponding rates of 1·2 and 1·3 per 1000 in the English and Scotch towns respectively. The deaths attributed to measles, which had been 13, 15, and 10 in the three

* Including membranous croup. † The death-rates are corrected for variations in sex- and age-constitution of the populations of the several boroughs, the population of England and Wales being taken as the standard.

preceding weeks, rose to 14 last week, and comprised 6 in Dublin, 4 in Belfast, 3 in Sligo, and 1 in Lurgan. The deaths of infants (under 2 years) referred to diarrhœa and enteritis, which had been 11, 14, and 13 in the three preceding weeks, were 14 last week, of which 6 occurred in Dublin and 6 in Belfast. The fatal cases of whooping-cough, which had been 6, 10, and 5 in the three preceding weeks, were 6 last week, and included 4 in Belfast. The 5 deaths attributed to scarlet fever, of which 3 occurred in Dublin and 2 in Belfast, were equal to the average in the four preceding weeks. The 2 deaths from diphtheria were registered in Dublin, and the fatal cases of enteric fever in Dublin and Belfast. In addition to the above a fatal case of typhus was recorded in Belfast.

The deaths referred to diseases of the respiratory system, which had been 57, 41, and 53 in the three preceding weeks, fell to 41 in the week under notice. Of the 371 deaths from all causes, 123, or 33 per cent., occurred in public institutions and 7 resulted from various forms of violence. The causes of 15, or 4·0 per cent., of the total deaths were not certified either by a registered medical practitioner or by a coroner after inquest; in the 97 large English towns the proportion of uncertified causes did not exceed 1·1 per cent.

VITAL STATISTICS OF LONDON DURING JUNE, 1914.

In the accompanying table will be found summarised complete statistics relating to sickness and mortality in the City of London and in each of the metropolitan boroughs. With regard to the notified cases of infectious diseases, it appears that the number of persons reported to be suffering from one or other of the specified diseases was equal to an annual rate of 7·6 per 1000 of the population, estimated at 4,516,612 persons in the middle of the year; in the three preceding months the rates were 7·4, 6·3, and 7·5 per 1000 respectively. The lowest rates last month were recorded in Hampstead, Stoke Newington, Hackney, City of London, and Wandsworth; and the highest rates in the City of Westminster, St. Pancras, Finsbury, Southwark, and Deptford. Scarlet fever was rather more prevalent than in the preceding month; the greatest proportional prevalence of this disease last month was recorded in Kensington, Hammersmith, the City of Westminster, St. Pancras, Southwark, Lambeth, Camberwell, and Deptford. The Metropolitan Asylums Hospitals contained 3045 scarlet fever patients at the end of last month, against 3138, 2826, and 2859 at the end of the three preceding months; the weekly admissions averaged 396, against 337, 312, and 376 in the three preceding months. Diphtheria also showed a slightly increased prevalence last month; this disease was proportionally most prevalent in Paddington, St. Pancras, Stepney, Bermondsey, Camberwell, Deptford, and Greenwich. The number of diphtheria patients under treatment in the Metropolitan Asylums Hospitals, which had been 1306, 1121, and 1078 at the end of the three preceding months, had risen to 1080 at the end of last month; the weekly admissions averaged 140, against 158, 114, and 130 in the three preceding months. Enteric fever was slightly less prevalent than it had been in the preceding month; the greatest proportional prevalence of this disease occurred in Chelsea, St. Marylebone, Finsbury, Poplar, and Lewisham. The Metropolitan Asylums Hospitals contained 40 enteric fever patients at the end of June, against 66, 55, and 39 at the end of the three preceding months; the weekly admissions averaged 8, against 7 and 6 in the two preceding months. Erysipelas was proportionally most prevalent in Finsbury, Shoreditch, Bethnal Green, Poplar, Southwark, and Deptford. The 39 cases of puerperal fever notified during the month included 5 in St. Pancras, 5 in Wandsworth, 4 in Hackney, 3 in the City of Westminster, 3 in Stepney, and 3 in Southwark. The 6 cases of cerebro-spinal meningitis belonged respectively to Hammersmith, Islington, Poplar, Bermondsey, Camberwell, and Greenwich; and the 4 cases of poliomyelitis to St. Pancras, Stepney, Poplar, and Lambeth.

The mortality statistics relate to the deaths of persons actually belonging to the several boroughs, the deaths occurring in institutions having been distributed among the boroughs in which the deceased persons had previously resided; the death-rates from all causes are further corrected for variations in the sex- and age-constitution of the population of the several boroughs. During the five weeks ending July 4th the deaths of 5450 London residents were registered, equal to an annual rate of 12·6 per 1000; in the three preceding months the rates were 15·2, 13·8, and 12·9 per 1000 respectively. The death-rates last month ranged from 8·9 in Lewisham, 9·7 in Wandsworth, 9·8 in Hampstead, 10·8 in Fulham and in Chelsea, and 11·2 in Kensington, to 16·2 in Holborn, 16·3 in Bermondsey, 16·4 in Stepney, 17·7 in the City of London, and 18·2 in Finsbury and in Shoreditch. The 5450 deaths from all causes included 499 which were attributed to the principal infectious diseases; of these, 174 resulted from measles, 24 from scarlet fever, 65 from diphtheria, 120 from whooping-cough, 12 from enteric fever, and 104 from diarrhœa and enteritis among children under two years of age. The lowest death-rates from these diseases last month were recorded in Kensington, Chelsea, the City of Westminster, Hampstead, Holborn, and Wandsworth; and the highest rates in Finsbury, Shoreditch, Bethnal Green, Stepney, Poplar, and Bermondsey. The 174 fatal cases of measles were 14 fewer than the corrected average number for the corresponding period of the five preceding years; this disease was proportionally most fatal in Finsbury, Shoreditch, Stepney, Bermondsey, and Greenwich. The 24 deaths from scarlet fever were slightly in excess of the corrected average number, and included 3 in Southwark, 3 in Camberwell, and 2 each in St. Pancras, Stepney, Lambeth, and Woolwich. The 65 deaths from diphtheria were 33 above the corrected average number; the greatest proportional mortality from this disease occurred in Paddington, Hackney, Stepney, Deptford, and Greenwich. The 120 deaths from whooping-cough were 20 in excess of the corrected average, the highest death-rates from this disease being recorded in Islington, Finsbury, Shoreditch, Bethnal Green, and Lewisham. The 12 fatal cases of enteric fever exceeded by 4 the corrected average number, and included 2 in St. Marylebone and 2 in Lambeth. The mortality from diarrhœa and enteritis among children under two years of age was proportionally greatest in Stoke Newington, Finsbury, Shoreditch, Bethnal Green, Stepney, and Poplar. In conclusion, it may be stated that the aggregate mortality in London last month from the principal infectious diseases, excluding diarrhœa, was nearly 11 per cent. above the average.

THE SERVICES.

ROYAL NAVY MEDICAL SERVICE.

THE following appointments have been notified:—Fleet-Surgeon: R. M. Richards to the *President*, additional, for Recruiting Headquarters, temporarily. Staff-Surgeons: W. N. Blatchford to the *Pembroke*, additional, for disposal; and E. F. Ellis to the *Assistance*, vice Richards. Surgeons: F. H. Stephens to the *Victory*, additional, for disposal; A. V. J. Richardson to the *Attentive*; J. H. Burdett to the *Bulwark*; and W. Mearns and A. L. Robinson to the *Pembroke*, additional for disposal.

Surgeon George Murray Levick has been promoted to the rank of Staff Surgeon in His Majesty's Fleet (dated Nov. 21st, 1910).

ROYAL ARMY MEDICAL CORPS.

Lieutenant Basil H. H. Spence is seconded for service with the Egyptian Army (dated June 30th, 1914).

Lieutenant Pierce M. J. Brett is seconded for service with the Egyptian Army (dated July 1st, 1914).

Colonel F. C. Jones has been appointed Assistant Director of Medical Services at Tidworth, Salisbury Plain. Colonel C. Birt has taken up duty as Assistant Director of Medical Services to the Sixth (Poona) Division of the Southern Army in India. Colonel S. Westcott, C.M.G., has joined at Portsmouth.

Lieutenant-Colonel T. H. Corkery has been appointed to the medical charge of troops at Fort Efford and Mutley District, Plymouth. Lieutenant-Colonel C. A. Lane has been appointed to hold charge of the Military Hospital at Madras Cantonment. Lieutenant-Colonel E. M. Pilcher, D.S.O., has taken up duty as Professor of Military Surgery at the Royal Army Medical College, Grosvenor-road. Lieutenant-Colonel M. J. Sexton has been appointed Senior Medical Officer at Wynberg. Lieutenant-Colonel F. W. Hardy has been granted six months' general leave of absence home from Allahabad Cantonment. Lieutenant-Colonel J. J. Russell has been placed under orders for service abroad. Lieutenant-Colonel F. Begbie has joined at Maymyo. Lieutenant-Colonel S. C. Philson has been appointed to hold charge of the Military Hospital at Lucknow Cantonment. Lieutenant-Colonel S. Macdonald has taken up duty as Medical Inspector of Recruits at Headquarters of the Southern Command. Lieutenant-Colonel W. L. Gray has arrived home on leave of absence from Jullundur Cantonment.

Major H. G. Pinches has been appointed to the Military Hospital at Sheerness on transfer from Chatham. Major W. Davis has been transferred from the Military Hospital at Meerut Cantonment to Naini Tal. Major S. W. Sweetnam has been appointed Senior Medical Officer at Sheerness. Major G. M. Goldsmith has been transferred from Lebong Cantonment to the Dublin District. Major J. G. Gill has joined at Devizes. Major D. L. Harding has been transferred from the Military Hospital at Londonderry to Mullingar. Major A. G. Thompson has taken up duty at Honiton. Major H. M. Nicholls has arrived home for duty from Poona Cantonment. Major J. B. Anderson has been appointed Embarkation Medical Officer at Southampton Docks. Major H. W. Long has been transferred from the Military Hospital at Choulston to hold medical charge of the Cavalry School at

Netheravon. Major F. Ashe has been appointed Specialist in Midwifery and Diseases of Women and Children to the Ninth (Secunderabad) Division. Major S. M. Adye-Curran has taken up duty on the staff of the Military Hospital at Sialkot Cantonment. Major J. Hennessy has been selected for advancement to the rank of Lieutenant-Colonel. Major E. V. Aylen has been appointed Senior Medical Officer at Barian. Major E. T. F. Birrell has been placed under orders for service abroad during the coming trooping season. Major A. H. Morris has arrived home on leave of absence from the Military Hospital at Malta. Major J. Powell has been appointed to the Egyptian Army. Major P. MacKessack has taken up duty as Specialist Sanitary Officer at Headquarters of the Eastern Command. Major F. S. Penny has been appointed to hold charge of the Military Hospital at Limerick. Major J. G. MacNaught has joined the Aldershot Command. Major C. R. Evans has arrived home on leave of absence from Malta. Major G. J. Houghton has arrived home for duty from Sierra Leone Protectorate. Major J. C. B. Statham has been transferred from the London District to the Sierra Leone Protectorate. Major L. P. More has been appointed to hold charge of the Military Hospital at Wellington.

Captain R. Storrs has been appointed to the Military Hospital at Winchester. Captain D. G. Carmichael has been transferred from the Military Hospital at Sialkot Cantonment to Cliffden. Captain T. J. Hallinan has taken up duty at Multan Cantonment. Captain G. de la Cour has been appointed for the course of instruction for promotion to the rank of Major at the Royal Army Medical College. Captain C. Scaife has been appointed to the Northern Command on transfer from Belgaum. Captain E. Caddell has been transferred from the Dublin District to the Eastern Command. Captain W. F. M. Loughnan has joined at Hounslow. An exchange on the roster for service abroad has been approved between Captain H. O. M. Beadnell and Captain A. C. Osburn. Captain R. F. O'T. Dickinson has been appointed to the Dublin District. Captain R. C. Phelan has taken up duty in the Irish Command on transfer from Barrackpore. Captain C. H. Denyer has been transferred from the Military Hospital at Agra to the Southern Command. Captain W. K. Beaman has been appointed to the Military Hospital at York on transfer from Malta. Captain O. R. McEwen has been transferred from Multan Cantonment to the Military Hospital at Londonderry. Captain W. W. Browne has been appointed Staff Surgeon at headquarters of the Ahmednagar Brigade. Captain G. P. A. Bracken has joined at Lichfield. Captain S. Field has been appointed to hold medical charge at Queenstown on transfer from Jamaica. Captain F. H. M. Chapman has been transferred from the Military Hospital at Meerut Cantonment to Delhi. Captain A. S. Cane has been appointed to Kirkee. Captain W. E. Marshall has taken up duty at the Military Hospital, Cork, on transfer from Kinsale. Captain W. Byam has joined the Egyptian Army. Captain M. O. Wilson has been transferred from the Military Hospital at Aden to Chatham. Captain W. H. S. Burney has been appointed to Ferozepore. Captain R. A. Bryden has been appointed to hold charge of the Military Hospital at Fleetwood. Captain R. C. Hallowes has joined at Holywood. Captain F. Casement has been transferred from the Military Hospital at Lucknow Cantonment to Edinburgh. Captain P. J. Hanafin has been appointed Specialist in Ophthalmology at Dublin.

Lieutenant A. Hood has been appointed to the Military Hospital at Rawal Pindi Cantonment on transfer from Lichfield. Lieutenant J. H. M. Frobisher has embarked for service in India. Lieutenant H. W. L. Allott has been transferred from the Military Hospital at Lucknow to Bareilly Cantonment. Lieutenant M. Beddingfield has been placed under orders for service abroad during the coming trooping season. Lieutenant B. Biggar has taken up duty at Cairo. Lieutenant T. C. Sproule has been appointed to hold medical charge at West Down Camp, Salisbury Plain, on transfer from the Military Hospital at Taunton. Lieutenant H. N. Sealy has joined the Belfast District.

INDIAN MEDICAL SERVICE.

The King has approved the promotion of the following officers of the Indian Medical Service:—Lieutenant-Colonels to be Colonels: Hormasjie Eduljie Banatvala (dated April 2nd, 1914). Percy Charles Hutchison Strickland (dated May 15th, 1914).

Surgeon-General C. P. Lukis, K.C.S.I., Honorary Surgeon to His Majesty the King, has been appointed to officiate as Sanitary Commissioner with the Government of India during the absence on leave of the Honourable Major J. C. Robertson, C.I.E.

Colonel A. O. Evans, Inspector-General of Civil Hospitals in Burma, has been granted combined leave of absence home for eight months. Colonel C. J. Bamber, C.V.O., on return to duty from leave of absence, has been appointed Inspector-General of Civil Hospitals in the Punjab, vice Lieutenant-Colonel G. F. W. Braide, officiating.

Lieutenant-Colonel G. McIver Smith, civil surgeon at Ludhiana, has been selected for appointment as Civil Surgeon at Murree Cantonment. Lieutenant-Colonel D. M. Davidson, civil surgeon at Lahore, has been granted three months' leave of absence.

The services of Major M. Corry have been placed temporarily at the disposal of the Government of India for employment in the Delhi Province. Major J. G. G. Swan, civil surgeon at Jhelum, has been selected for appointment as Civil Surgeon and Professor of Forensic Medicine and Toxicology at the Medical College, Lahore, vice Lieutenant-Colonel D. M. Davidson, granted leave of absence. The services of Major M. MacKelvie have been placed at the disposal of the Government of Bengal. Major H. M. Melhuish, on return from leave of absence, has been appointed as Plague Medical Officer at Gurgaon. Major E. L. Perry has been appointed to officiate as Sanitary Commissioner of the Punjab. The services of Major R. McCarrison have been replaced at the disposal of the Foreign Department. Major W. Glen Liston has taken up duty as Director of the Bombay Bacteriological Laboratory. Major W. R. Battye has joined at Mewar as Residency Surgeon. Major H. J. Walton has been appointed Professor of Pathology at King George's Medical College, Lucknow. Major J. R. J. Tyrrell has been appointed Civil Surgeon at the Khyber. Major F. P. Mackie has been granted three months' privilege leave of absence.

Captain C. I. Brierly has been selected for appointment to hold civil medical charge at Peshawar. The services of Captain N. G. McVean have been placed at the disposal of the Government of Bombay for employment in the Civil Medical Department. Captain C. H. Cross has joined at Madras. Captain A. N. Dickson has been appointed to officiate as Agency Surgeon at Maskat. The services of Captain C. E. Palmer have been placed permanently at the disposal of the Government of the United Provinces of Agra and Oudh for employment in the Jail Department. Captain J. B. D. Hunter has been granted an extension of leave of absence home from India. Captain L. Cook has been appointed to officiate in civil medical charge at Champaran. Captain J. Kirkwood has taken up duty as District Medical and Sanitary Officer at Canara. Captain D. P. Goll has joined the Civil Medical Department of Bengal Presidency. Captain R. Kelsall has been granted leave of absence. Captain L. B. Scott has been appointed Civil Surgeon and Superintendent of the Prison at Sylhet, Assam. Captain H. G. Stiles Webb has taken up duty as Chief Malaria Medical Officer in the Punjab. Captain J. P. Cameron, superintendent of prisons at Madras, has been appointed Superintendent of the Central Prison at Coimbatore. Captain A. H. Napier has been appointed to the Bacteriological Department for duty at the Central Research Institute at Kasauli. Captain C. Newcombe has been appointed to the Chemical Examiner's Department for duty at Calcutta. The services of Captain S. C. Chuckerbutty have been placed at the disposal of the Assam Government.

SPECIAL RESERVE OF OFFICERS.

Royal Army Medical Corps.

Lieutenant Eben S. B. Hamilton to be Captain (dated June 29th, 1914).

Lieutenant William Crymble to be Captain (dated July 13th, 1914). Lieutenant Alexander J. Gibson and Lieutenant Thomas W. Wylie are confirmed in their rank. Cadet Corporal George Perkins, from the Oxford University Contingent, Officers Training Corps, to be Lieutenant (on probation) (dated May 20th, 1914).

TERRITORIAL FORCE.

Royal Army Medical Corps.

2nd South-Western Mounted Brigade Field Ambulance, Royal Army Medical Corps: The order of precedence of the undermentioned Captains whose appointments were announced in the *London Gazette* of May 15th, 1914, to be as now shown: John Munro Dupont and Henry Norman Barnett.

East Anglian Clearing Hospital, Royal Army Medical Corps: William Redpath to be Lieutenant (dated July 18th, 1914).

Wessex Clearing Hospital, Royal Army Medical Corps: Alfred John Hopkinson Iles to be Lieutenant (dated June 9th, 1914).

3rd South Midland Field Ambulance, Royal Army Medical Corps: Henry James Drew Smythe to be Lieutenant (dated June 18th, 1914).

Attached to Units other than Medical Units.—Lieutenant Robert Henry to be Captain (dated July 9th, 1914). Lieutenant-Colonel and Honorary Surgeon-Colonel David Lennox resigns his commission, and is granted permission to retain his rank and to wear the prescribed uniform (dated July 22nd, 1914). Captain Thomas Harper resigns his commission, and is granted permission to retain his rank and to wear the prescribed uniform (dated July 22nd, 1914). Captain George B. Gill resigns his commission (dated July 22nd, 1914).

EXAMINATION FOR PROMOTION TO STAFF-SURGEON, R.N.

At the recent examinations held at Greenwich and London the following surgeons qualified for promotion to the rank of Staff-Surgeon: George M. Levick, Arthur T. Rivers, Thomas R. L. Jones, Kenneth H. Hole, Gilbert F. Syms, Hugh F. Briggs, Michael P. Fitzgerald, James Barrett, Gordon A. Jackson, Alfred G. Malcolm, Horace C. Devas, and Harry W. Nichols. Two of these officers—Surgeon Hole and Surgeon Syms—obtained first-class certificates, thus becoming eligible for accelerated promotion to the extent of 12 months' seniority.

NAVAL MEDICAL SUPPLEMENTAL FUND.

At the quarterly meeting of the directors of the Naval Medical Supplemental Fund, held on July 14th, Inspector-General W. Harris Lloyd in the chair, the sum of £52 was distributed among the several applicants.

ANNUAL MEETING OF THE AMERICAN MEDICAL ASSOCIATION.

(FROM OUR OWN CORRESPONDENT.)

THE sixty-fifth annual meeting of the American Medical Association was held in Atlantic City from June 22nd to 26th, and proved a highly successful gathering. Atlantic City, the popular New Jersey seaside resort, is well adapted for a meeting of this character, being situated at convenient distances from the principal cities of the eastern part of the United States, and containing ample accommodation for visitors. It is also provided with buildings admirably suited to the holding of meetings. For these reasons the attendance of medical men was larger than at any previous meeting, and from the medical and scientific standpoint the papers read were, generally speaking, of a high standard.

Opening Meeting: Presidential Address.

At the opening meeting of the house of delegates Dr. JOHN A. WITHERSPOON, of Nashville, Tenn., the retiring President, apologised for not having, through ill-health, been able to prepare an address, and the various reports were then received. Among these was that of a committee appointed to advise on an invitation from the British Medical Association to hold a joint meeting in Cambridge from July 6th to 10th, 1915. The committee held that the invitation would have to be declined, as the constitution and by-laws of the American Medical Association provided that the annual meeting should be held at some place in the United States, but suggested that the British body be invited to meet with the American body at the earliest date possible.

On Tuesday, June 23rd, at a general session, a gold medal in the name of the American Medical Association was conferred on Surgeon-General William C. Gorgas in recognition of his labours to render the Isthmian Canal zone healthy, thus making it possible to build the Canal.

Dr. VICTOR C. VAUGHAN, of Ann Arbor, Michigan, the President for the year, then delivered his address, in which he reviewed the service of medicine to civilisation. "We boast," he said, "of a great civilisation, but this is justified only within limits. Science more nearly dominates the world than at any time in the past. Learning permeates the masses more deeply, but credulity and ignorance are widely prevalent. In this country of nearly one hundred millions there are thousands whose greed impedes the progress of the whole, tens of thousands whose ignorance retards their own growth, and other thousands who live by crime and procreate their kind to live on generations to come. We have our schools, colleges, and universities, but our almshouses, insane asylums, and penal institutions are full. In our cities we see the palatial homes of the ultra rich, the splendid temples of trade and commerce, the slums of want and poverty, and the homes, both rich and squalid, of vice and crime. No nation in this condition can be given a clean bill of health. Our hill-tops are illuminated by the light of knowledge, but our valleys are covered by the clouds of ignorance. We have not emerged from the shadows of the dark ages. The historian of the future will have no difficulty in convincing his readers that those who lived at the beginning of the twentieth century were but slightly removed from barbarism; he will tell that the school, saloon, and house of prostitution flourished in close proximity; that the capitalist worked his employees under conditions which precluded soundness of body; that the labour union man dynamited buildings; that whilst we sent missionaries to convert the Moslem and Buddhist 10,000 murders were committed in our midst; and that a large percentage of our mortality was due to preventable disease."

Papers read in the Sections.

In the Section on Obstetrics, Gynæcology, and Abdominal Surgery a symposium on surgery of the large intestine was held. Dr. WILLIAM J. MAYO, of Rochester, Minn., contributed a paper dealing with resection of the first portion of the large intestine and the resulting effect on its function. He said that in the past too much importance had been attributed to purely incidental changes in the position and attachment of the large intestine, bands, kinks, and adhesions of a normal character being thus given a fictitious rôle in the production of symptoms. The results of resection were good in suitable cases, patients who showed exaggerated conditions of cæcocolic stasis being relieved of these conditions. Among his own operations of this character there had been no deaths.

In the section on Surgery Dr. JOSEPH BLOODGOOD, of Baltimore, in a paper entitled "The Relations of the Surgeon to the Conquest of Cancer," assigned the mortality from cancer chiefly to ignorance or fear of operation, which led to delayed or bad treatment. He was in favour of a diffusion of information among the medical profession and the public through the lay and medical press. This information should be under the absolute control of responsible medical authority. He emphasised the importance of early thorough operation. The difficulty of making an early diagnosis must be met by the physician.—Mr. EDRED M. CORNER, surgeon to St. Thomas's Hospital, London, discussed the importance of the crucial ligaments in injuries of the knee-joints.[1] He believed that many injured ligaments had been overlooked, which accounted for poor functional results after fracture. He showed diagrams on the screen of fractured spines of tibiæ, and believed them to be overlooked occasionally. Portions of torn ligaments and periosteum sometimes became free bodies within the knee-joint.—Dr. J. B. MURPHY, of Chicago, who discussed Mr. Corner's contribution, stated that it was the first of its kind considered before the American Medical Association.

In the Section on Diseases of Children Dr. F. C. NEFF, of Kansas City, read a paper on the Feeding of Infants with Skimmed Breast Milk. He said he had found that when the fat content was reduced the digestion improved, the emptying of the stomach being facilitated. Only a temporary reduction of the fat might be necessary. Later the child might have an increased tolerance for fat. In cases of severe digestive disturbance, persistent vomiting, or pylorospasm, complete recovery often followed the removal of fat from the breast milk. The method employed by him was to obtain 24 hours' supply of breast milk, which was kept on ice, the supply of the previous 24 hours being used for feeding. The milk was placed in a rubber-stoppered bottle with a tube at the bottom for withdrawing the milk without the fat. In this way the reduction of fat could be measured.

The following officers were elected for the coming year. President, Dr. H. L. Rodman (Philadelphia); Vice-Presidents, Dr. E. S. Fairchild (Kansas City, Mo.); Dr. D. Misner R. Townsend (New York); Dr. Alice Hamilton (Chicago); Dr. William E. Darnall (Atlantic City, N.J.); Secretary, Dr. Alexander R. Craig (Chicago); Treasurer, Dr. William Alan Pusey (Chicago).

---

[1] THE LANCET, May 9th, 1914, p. 1317.

CENTRAL LONDON THROAT AND EAR HOSPITAL AND THE CLINICAL CONGRESS OF SURGEONS.—We are asked to say that the medical staff of the Central London Throat and Ear Hospital, Gray's Inn-road, W.C., will welcome their American *confrères* at breakfast at the Great Northern Railway Hotel, King's Cross, at 9 A.M. on Thursday, July 30th, and afterwards, at 10 A.M., at a demonstration of interesting cases at the hospital. Cards of invitation will be sent on application to the Dean.

Home and Foreign Notes.

(FROM OUR OWN CORRESPONDENTS.)

MANCHESTER.

New Central Branch of the Royal Infirmary, Manchester.

THE Central Branch for Accidents and Out-patients of the Royal Infirmary, which has been built in a convenient situation in the centre of the city and which has cost £25,000, will be opened in a few weeks. The buildings are practically complete, and they are now being furnished. On the ground floor is a large vestibule from which there open rooms for consultation and for the examination of out-patients, medical and surgical. The several rooms have communicating doorways, so that the medical officers need not pass through the vestibule to reach an adjacent room. There is a special accident room, in addition to two rooms each with two beds for cases requiring observation. On the same floor there is an X ray installation and an operating theatre.

A Babies' Hospital.

Arrangements have been made by the medical women of Manchester for the provision on a small scale of a babies' hospital for the more effective treatment of babies and very young children suffering from diarrhœa and other gastro-intestinal disorders. It is felt that in a general hospital it is not always possible to give that attention to those cases which is necessary, while there is but little accommodation for nursing babies. To begin with, the number of patients at any one time in the hospital will be limited to 12. A house has been secured, and it is estimated that the cost of carrying out the scheme for the first year will be £800. Of this amount a lady donor has offered £300 if the expenses for opening on August 1st are secured.

Blackpool Hospital Dispute.

The regrettable dispute between the honorary surgeons and the board of management of the Blackpool Victoria Hospital has entered on a new phase. The dispute began last year and has continued ever since. The nurses' dietary has been rectified; the matron has voluntarily tendered her resignation and a new matron has been appointed. Six in all of the honorary medical staff have resigned. The doctors made a suggestion regarding a medical member of the board of management which has not been acted on, hence the trouble. The medical staff called for the resignation of this medical man from the board of management. Last night, Dr. Buckley presiding, a meeting of medical practitioners of Blackpool was held, and a proposal to found a cottage hospital was adopted unanimously, and enough money was guaranteed at the meeting to set the undertaking agoing. Mr. R. H. W. Dunderdale will for the present act as secretary and treasurer. The hospital will be used to deal with acute surgical emergencies amongst the medical practitioners' own cases.

A Manchester Man for the Antarctic Expedition.

Dr. Alexander H. Macklin has resigned his position as senior house surgeon at the Blackburn Infirmary on his appointment as one of the surgeons in Sir Ernest Shackleton's forthcoming Polar expedition. Dr. Macklin graduated in medicine at Manchester in July, 1912.

July 21st.

BIRMINGHAM.

Milk-supply.

THE public health committee is issuing a circular drawing the attention of farmers and milk dealers to the necessity of taking care to ensure that the milk is free from contamination. The following is the suggested method of milking to secure greater cleanliness: (1) The cows and cowsheds to be kept clean; (2) all long hairs on udders and flanks of cows to be kept short by clipping; (3) cows' flanks to be damped with a brush and their udders wiped clean with a wet cloth before milking to prevent dust and dirt from falling into the milk; (4) milkers to wash their hands with soap and water before milking and to wear clean overalls; (5) a covered milking pail to be used with an opening in the side; and (6) the milk to be immediately removed from the cowshed into a clean dairy and passed through a strainer and cooled. Bacteriological experiments have been made recently in Birmingham at four good dairy farms. The number of germs in 1 c.c. after two hours in milk obtained by ordinary methods varied from 360 to 147,500, the average being 41,312. With the special method they varied from 140 to 400, and the average was 234. The health committee has also issued a circular to shopkeepers who sell feeding bottles appealing to them to stop the sale of bottles with long tubes in the interests of the community.

The City Sanatorium.

The opening of the new buildings of the City Sanatorium, Yardley-road, by the Lady Mayoress will take place on July 24th. Sir Robert Philip will give a short address.

July 22nd.

SCOTLAND.

Meeting of the Royal Institute of Public Health.

THE annual meeting of the Royal Institute of Public Health commenced in the Usher Hall, Edinburgh, on Wednesday evening, July 15th, when the President of the congress, the Marquis of Linlithgow, delivered the opening address before a distinguished audience. The address, which was listened to with attention, dealt with the difficulties, technical, political, and economic, with which science had to contend in combating the great public health problems of the day, and called attention to the need for educating public opinion. At the close of the address Lord Linlithgow was admitted to the honorary Fellowship of the institute and Lord Provost Inches to honorary life membership. The medal of the institute for conspicuous service in the cause of preventive medicine was awarded to Dr. James Niven, medical officer of health of Manchester, for his work in the direction of the prevention of tuberculosis. The work of the congress was continued until Monday, July 20th, when the proceedings closed by a public lecture delivered by Dr. Otto Neustatter, of Dresden. The congress was attended by a large number of prominent medical men and sanitarians.

Health of Aberdeenshire: Annual Report of the Medical Officer of Health.

Dr. J. P. Watt, medical officer of health of the county of Aberdeen, states in his annual report for 1913 that emigration from the county has received a check, its trend also having been deflected somewhat from Canada to Australia and New Zealand. The birth-rate for the county, as estimated by the Registrar-General, was 24·082 per 1000, and the illegitimate birth-rate was 18·2. The death-rate was 13·770 per 1000 on the Registrar-General's population. The death-rate of children under 1 year of age was 94·4 per 1000 births. The death-rate from tuberculosis was at the rate of 720 per million, as compared with 801 for 1912. Dr. Watt notes that from a paper published by Dr. A. K. Chalmers, medical officer of health of Glasgow, the death-rate from phthisis would appear to have fallen in Aberdeenshire from 2210 deaths per million in 1860–62 to 898 deaths per million in 1908–10, a fall of 59·4 per cent. In 1860–62 Aberdeenshire came twenty-second in the list of Scottish counties with the lowest death-rate from phthisis; in 1908–10 it came sixth, the counties having less deaths per million persons from consumption being Peebles, Fife, Wigtown, Haddington, and Berwick.

Appointment to Chair of Chemistry at Aberdeen University.

Mr. Frederick Soddy, M.A., F.R.S., was, at a meeting of the Aberdeen University Court held on July 14th, unanimously appointed to the chair of Chemistry in that University, rendered vacant by the resignation of Professor Japp. Mr. Soddy, who obtained a first class in the Honours School of Natural Science, Oxford, in 1898, went to Montreal as a demonstrator in the Chemical Laboratory at McGill University, where for three years he worked, largely in conjunction with Professor Rutherford, carrying on a combined chemical and physical investigation of radio-active phenomena. The result of this joint work was the general interpretation of radio-activity by the theory that the atoms of the radio-elements are undergoing spontaneous disintegration. Subsequently he was associated with Sir William Ramsay in London, and worked also at the Cavendish Laboratory, Cambridge, with Sir J. J. Thomson, with results too well known to need enumeration. In 1904 he was appointed to the newly instituted independent lectureship in physical chemistry in Glasgow, where he has remained until now, accomplishing much, working chiefly on the problems which surround the origin of radium.

Death of Dr. Alexander Reith.

Dr. Alexander Reith died at his residence, Aberdeen, on July 16th. He was a well-known practitioner in Aberdeen, and was a native of that city, having graduated M.D. at Marischal College in 1859. For some time subsequently he practised in England and France, and on his return to Aberdeen he acquired the practice of the late Dr. Erskine. Dr. Reith, who was highly respected by all who knew him, was of a retiring disposition, and spent much of his spare time in mechanical pursuits. He was a widower, and is survived by three sons and three daughters.

Anthrax at Buddon Camp: Territorial Attacked.

A case of anthrax was discovered at Buddon Camp on Wednesday of last week, the victim being one of the members of the 2nd Battery, 1st Highland Brigade, R.F.A., from Aberdeen. The patient was promptly removed to Aberdeen Infirmary, and all precautions were taken to prevent the spread of the disease. It is supposed that the man contracted the disease before going to camp, as in the course of his occupation he might readily have done so.

July 21st.

IRELAND.

Irish Medical Committee.

AT a meeting of this committee held on July 14th in the Royal College of Surgeons, Dublin, Dr. P. J. Macnamara and Dr. R. J. Johnstone were unanimously re-elected as chairman and vice-chairman. Financially the gross receipts for the year came to £597 0s. 4*d.*; the expenditure up to date was £624 10s., which left a debit balance of £27 9s. 8*d.* This deficit it was decided to carry forward to next account. The following subcommittees were appointed:—Finance and executive: M. R. J. Hayes, Dublin; R. J. Rowlette, Dublin; R. M. Blake, Mountpleasant; J. Power, Ardfinnan; W. Doolin, Dublin; J. S. Darling, Lurgan; A. A. McConnell, Dublin; P. J. O'Brien, Cork; and W. J. O'Sullivan, Limerick. Sanatorium: T. J. Kelly, Enniscorthy; R. J. Rowlette, Dublin; J. J. O'Sullivan, Waterford; J. Power, Ardfinnan; M. R. J. Hayes, Dublin; S. Agnew, Lurgan; P. J. Hamilton, Arklow; T. A. Davidson, Belfast; R. P. McDonnell, Dublin; J. Giusani, Cork; L. Kidd, Enniskillen; and D. Forde, Strokestown. Poor-law: G. E. Greene, Ferns; O. P. Kerrigan, Castletown Geoghegan; W. W. Murphy, Inch; T. J. Kelly, Enniscorthy; C. H. Foley, Ardrahan; W. J. Burns, Belfast; T. T. Collins, Ballinasloe; T. Donnelly, Dublin; A. C. Callaghan, Ahascragh; J. J. O'Connor, Queenstown; G. A. Hickey, New Ross; J. M. S. Kenny, Granard; J. F. Fagan, Oldcastle; and P. Donnellan, Castlerea. Hospital: R. J. Rowlette, Dublin; R. J. Kinkead, Galway; G. A. Hickey, New Ross; E. C. Thompson, Omagh; E. W. Allsom, Cork; J. S. Darling, Lurgan; H. T. Warnock, Donegal; R. C. Peacocke, Blackrock; S. Pringle, Dublin; L. Kidd, Enniskillen; W. A. Fogarty, Limerick; J. Cotter, Cork; G. I. Mackesy, Waterford; L. A. Byrne, Dublin; Sir John Lentaigne, Dublin; Sir John Byers, Belfast; Sir Alexander Dempsey, Belfast; Sir Andrew Horne, Dublin; and J. S. McArdle, Dublin.

The Water-supply of Dublin.

The long spell of dry weather has had its effect on the Roundwood reservoir, from which Dublin and most of the outlying townships draw their water-supply. The last dry season was 1911, and in that year the city was in measurable distance of a water famine when rain began to fall. At present the level in the reservoir is 3 feet 3 inches lower than it was on the same date in 1911. In 1893 there was a complete failure, and for several weeks of the autumn of that year the citizens were dependent on a supply drawn from the Grand Canal. The question arises as to why the corporation, after two such warnings, does not make adequate provision. For several years past work has been going on at Roundwood to increase the storage of water, but the progress is very slow, and the city is in danger every dry summer. The irritation felt by the citizens is not allayed by the bland advice which emanates from the waterworks committee of the corporation. The chairman of that body wrote to the press recently requesting water consumers to refrain from unnecessary use of water, and, in particular, from taking baths, flushing drains, and watering gardens. It is said that should the Roundwood supply give out the corporation is in a position again to make use of canal water.

Water-supply of Belfast.

The Belfast Water Commissioners, owing to the feared scarcity of water, have been obliged to issue notices to the public warning them against wastage of water and urging care in its use.

Accident to a Medical Man.

I regret to report that Mr. J. Kean, J.P., of Newry, medical officer for Meigh dispensary district, lies in a very precarious condition in the Newry General Hospital owing to a motor accident. It appears that on the evening of July 16th Mr. Kean with his wife and a friend were returning in his motor-car from Greenore, when in taking a sharp turn in the road the car was overturned and all the occupants were pitched out. Dr. Donegan, of Carlingford, chancing to come on the scene with his motor-car, conveyed Mr. Kean to Newry, where, after being seen by Dr. S. E. Martin, he was taken to the Newry General Hospital in an unconscious state. The latest information is that Mrs. Kean is much better, but that her husband is still in a very critical condition.

July 20th.

PARIS.

Immunisation against Rabies.

Madame Phisalix, who is attached to the Laboratory of Experimental Physiology of the Museum of Natural History, has made an interesting discovery with regard to the neutralisation of the virus of rabies by the venoms of batrachians and snakes. These two viruses appear to neutralise one another and to create an immunity in a subject subsequently inoculated with the virus of rabies. Many rabbits were given by intravenous injection about 10 mgm. of viper venom—a dose double the lethal quantity, as proved at the same time with controls. Six days after the last test the rabbits thus treated were trephined and fixed rabic virus was injected under the meninges. Control rabbits treated in the same way without any preventive inoculation were attacked by rabies some hours later. Of six rabbits inoculated with the venom of the salamander, five remained entirely unaffected. Only one, in which 15 days were allowed to elapse between the immunisation and the inoculation with rabies, died rabid. The duration of the immunity conferred by the association of the venom of snakes and batrachians is therefore quite short. Other experiments show its duration to be from three to six weeks, but that it completely disappears by the end of two months. Madame Phisalix has further been able to show that the association of the two venoms is necessary. Rabbits immunised with salamander or viper venom alone showed no resistance to the virus of rabies.

A Committee for the Dissemination of Hygienic Principles.

A committee has been established in Paris, at the suggestion of *Le Matin*, to disseminate information on the laws of hygiene and public health. It comprises Members of Parliament and of the Académie de Médecine, administrative officials, mayors of the *arrondissements* of Paris, and social workers. Three questions are selected for study and will be brought before a congress organised by the various groups. They are: (1) the rôle of the municipalities in the struggle against infant mortality; (2) hygiene at school and in the school; (3) the organisation of hygienic services in the departments. The question of hygiene at school has been made the subject of thorough discussion, and a vigorous campaign is to be undertaken to disseminate the idea that the school ought to be a powerful agent in the diffusion of hygienic knowledge throughout the world. Dr. Méry has been entrusted with the report on the first question, Dr. Mosny with that on the second, and Dr. Hott, of Rouen, with that on the third.

The Story of a Statue.

For more than 60 years a statue of Ambroise Paré presided silently over the meetings of the Société de Chirurgerie. But it was made of plaster, and one day a clumsy servant knocked it over and shattered it into a thousand pieces. Some weeks later Dr. Robert, medical inspector of the Army Sanitary Service, was shocked to find empty the place which belonged to the father of French surgery. He searched and found another statue of Paré, and in order to prevent a like disaster he had it cast in bronze, after which he generously offered it to his colleagues. A little informal ceremony was made of this occasion, when Dr. Tuffier, president of the society, complimented the donor, alluded to the close connexion between civil and military medicine, and praised the members for their loyalty to their ancestor.

An Anti-Opium League.

A league is being formed in Paris to combat the spread of the opium habit which, in addition to the ravages that it has made among the Asiatic colonies, is now spreading among the students and in literary circles where intellectual refinement contributes to the perversion. This league has for its honorary presidents Professor Charles Richet, member of the Academies of Science and of Medicine, and M. Le Myre de Villiers, senior Governor-General of French Indo-China. The acting president is Dr. Janselme, professeur agrégé of the Paris Faculty of Medicine, who is well acquainted with the East, and the secretary-general is Dr. Millant. The league proposes to enlighten the public, by means of pamphlets and meetings and other methods of publicity, upon the dangers of using narcotic drugs in general, for the fight against cocaine is included as an addition to the programme. It intends to wage energetic warfare against the traffickers in poison who swarm in Paris and in the naval ports.

A Forthcoming Congress.

The next Congress of the French Association for the Advancement of Science will be held this year at Havre from July 27th to August 2nd. It will have on this occasion a special *éclat* because of the connexion with the British Association, from which body a large number of scientists have accepted the invitation of the French Association and the town of Havre. Professor Armand Gautier will preside over the session, and Professor Albert Calmette, director of the Pasteur Institute at Lille, is vice-president of the Congress.

July 20th.

INDIA.

Lunacy in Bengal.

INTERESTING figures are given in the annual returns of the lunatic asylums in Bengal for 1913 of the cures effected during the year under review. From the proportion of cures given below among the different types of insanity it would seem that the type of insanity associated with Indian hemp smoking yields more easily to treatment than any other type: insanity due to hemp smoking, 14·38 per cent. to total treated; melancholia, 8·42 per cent.; delusional insanity, 6·60 per cent.; and mania, 6·25 per cent. The total expenditure of the lunatic asylums in Bengal in 1913 was Rs.1,94,451.

The Simla Improvement Scheme.

Major J.C. Robertson, Sanitary Commissioner with the Government of India, has proceeded to Aden to advise the local authorities on their new scheme to improve the water-supply of Aden. Surgeon-General Sir Pardey Lukis, I.M.S., will take his place on the committee appointed by Government to consider the improvement of Simla.

Sanitation in Lahore.

The fourth annual report, prepared by Dr. A. G. Newell, late health officer of Lahore, which has just been issued, shows that the infant mortality rate was 305·3 deaths per 1000 births. Of these infants 41·54 per cent. die within a month of birth, and 18·3 per cent. die within ten days. Much of this waste of life might be prevented by skilled attention at birth and by healthy conditions of food and environment during early days. A little is being done by the municipality, but much more is needed. The fact that more than half the deaths that take place in Lahore are those of children under 15 years of age demonstrates the need for improved sanitary measures. One of these measures which Dr. Newell has long urged is the improvement of the milk-supply. Milk-sellers are already licensed, and their licence is supposed to ensure that the milk is clean and unadulterated, but the regulations are defective. Dr. Newell advocates education of the cow-keepers in cleanliness, and in the proper feeding of cows, the elimination of cows from inside the city, and the establishment of model dairies. Other proposals, in view of the high infant mortality rate, are the appointment of two lady health visitors and the free registration of *dais*, so that the women could be reached and taught the rudiments of asepsis in midwifery. Both these measures would undoubtedly be most beneficial. After infant mortality the prevalence of pulmonary tuberculosis forms one of the most difficult problems before the health officer. This disease caused 630 deaths last year in Lahore, and it is estimated that there are over 6000 cases in the municipal area. The disease is much more prevalent among Mahommedans than among Hindus, and 47·46 per cent. of the deaths were among Mussulman women. Dr. Newell describes the preventive and educational work already being done, and urges the need for the appointment of a lady health visitor to go among the women. Direct instruction in the elements of sanitation is urgently needed, for by this means alone can the advantages of domestic and personal hygiene be brought home to the people.

Madras Town Planning.

It is understood that the Government of Madras have in contemplation a scheme for popularising the latest ideas in town planning and the building of model sanitary dwellings. With this end in view they are proposing to hold exhibitions and demonstrations and courses of lectures in the Presidency during the coming cold weather. This timely proposal will be welcomed by all as a step in the right direction, as a means of educating public opinion, preliminary to undertaking the necessary legislation.

Tuberculosis in Madras.

The Madras Corporation have decided to make tuberculosis compulsorily notifiable throughout the city. The initiative for this action came from the Government of Madras, which in January last requested the corporation to prepare a detailed report on the feasibility of introducing a system of compulsory notification into the city. The report of the city health officer supported the view that compulsory notification was necessary for the control of tuberculosis in this city. He recommended the payment to medical practitioners o 1 rupee fee, and the periodical disinfection of the rooms occupied by the patient. It has now been decided to adopt these measures, which will not however, come into force before the corporation have provided a sanatorium or farm colony for early cases. In addition, it is proposed to provide hospital accommodation for more advanced cases to organise stricter supervision of supplies of food and milk, and to attempt to educate both children and adults as to the cause, prevention, and cure of the disease. All these measures are highly practical, and reflect creditably on the business-like way in which Madras is approaching a difficult problem.

Mosquitoes in Ceylon.

According to an advance report of the mosquito survey of the Ceylon port, the investigations throughout 1913 revealed the fact that there were 50 different species of mosquito in Colombo, of which 15 were harmful. Several species were new to science and others not previously recorded either in Ceylon or India. Complete extermination, it is pointed out in the report, is practically impossible owing to the existence of a migratory species retaining its habit of breeding in swamps and natural pools at a distance from the centres of population, but accustomed to fly long distances to cities and towns, to feed on human blood.

Correspondence.

"Audi alteram partem."

ORAL SEPSIS AND THE EXTRACTION OF TEETH.

To the Editor of THE LANCET.

SIR,—I spent an hour a week or two ago with a medical man, who was quite a stranger to me, discussing the question "should he allow half his teeth to be extracted" for what had been called pyorrhœa alveolaris. He had already almost determined to content himself with the loss of four incisors. He was a man of nervous temperament, who had spent several recent years of ill-health—chiefly in pyrexial states that had been ascribed to streptococcal infections, for which he had been duly and repeatedly vaccined. But still it seemed that similar illnesses came upon him, and so I suppose his teeth had been pounced upon. I examined his mouth very carefully and his teeth were to my eye perfect; I would not speak positively as to the slightest possible gingivitis, at the edges of the gums, but I could not see it. He had commencing retrocession of the gums. I strongly demurred to the extraction of a single tooth.

Now, Sir, if this had been a solitary experience, however much I might differ from the advice that had been given, I should have nothing to say, but it is not so. In the last year or two hardly a week passes but I see man or woman said to be affected by pyorrhœa which is poisoning them, and where to save their health it is necessary to extract a number of teeth. I have several times heard that the whole lot had been condemned. In many another case a long course of vaccines had been advised or was being carried out, where I really could see nothing of importance in the way of disease and nothing to excuse such drastic treatment. I have as a result come very reluctantly to the conclusion that a good many of us have lost our heads (it has often happened so in medicine before), and that many are so obsessed by the idea of oral sepsis that they give way to the fanatical, inconsiderate, and reckless advice, that good teeth should be removed wholesale. And what for? For the most trivial ulceration of the edges of the gums that our forebears would have adequately treated by a mouthwash, and thought no more about it.

Everyone will admit that there is wisdom in taking more care of the teeth than has often been done in the past, but dirty mouths are not pyorrhœa, and the deep-seated pent-up suppuration in the alveoli that justifies the term and needs wholesale extraction of teeth is an uncommon disease; it is a painful malady, and I do not think there is much doubt about it when it is present. I have taken some time to consider this opinion, and I daily become more certain that an exaggerated view is too frequently taken of trivial conditions of the buccal mucous membrane, and that a harmful practice has come into vogue that needs to be held up.

I am, Sir, yours faithfully,

July 20th, 1914. JAMES F. GOODHART.

PS.—After the above was written Dr. R. C. Wingfield's paper on Oral Sepsis in Pulmonary Tuberculosis in THE LANCET of July 18th attracted my notice. Being of the nature of a report of an experimental inquiry, it is outside the purpose of my remarks. Nevertheless, I cannot help saying that somewhat of a shudder comes over me as I read that in 30 cases of phthisis, all of them as regards age in the prime of life, the teeth were removed "in bulk" for an assumed oral sepsis that can at best have been only problematical.—J. F. G.

THE TECHNIQUE OF ARTIFICIAL PNEUMOTHORAX.

To the Editor of THE LANCET.

SIR,—I must thank Dr. Clive Riviere for his critical interest in my paper on artificial pneumothorax. His criticisms in your issue of July 18th are numerous and I apologise if my reply is somewhat lengthy. I do not doubt that Dr. Riviere can pass a blunt needle through the parietal pleura so that the orifice rests in the pleural cavity without injuring the visceral pleura. This can be done with a sharp needle provided the point does not project beyond its orifice. What I maintain is that, even if the orifice is in the pleural cavity, he cannot obtain ample manometric oscillations without causing the lung to leak and thereby supply the necessary gas to communicate movements to the manometer. The fact that he does obtain such oscillations is, as I showed, ample proof that he does cause the lung to leak. If he is not satisfied with that proof it is for him to show how he obtains his oscillations or to point out the fallacies in my reasoning. In this connexion let us examine the details of one of his own cases—for example, that of H.B. In this case, at the first operation, he obtained manometric oscillations indicating an intrapleural pressure varying between −4 cm. and −12 cm. of water. Here, on the assumption that the lung did not leak, the maximum volume of gas entering the pleural cavity was equal to that of a column of 6 cm. of the fluid in his manometer. Of this very small volume he apparently thinks 4 cm. could have moved freely in and out through the needle to produce his oscillations. Having obtained these he asked his patient to cough. Am I right in assuming that his manometer then registered a positive pressure? If it did, he could not produce more conclusive proof that air had leaked into the pleural cavity, for a positive pressure could not be produced in his manometer except by more air than was originally present in it. If it did not register a positive pressure, such a disturbance as that caused by a cough was entirely unnecessary and likely to displace the delicately adjusted needle.

But Dr. Riviere does not appear to have considered the possibility of the valve action of the lung, although most readers will have recognised it as a frequent cause of difficulty in aspirating a pleural effusion, but, provided a sufficient quantity of fluid is still present, a difficulty overcome by altering the position of the needle. In reviewing the experiences which I described at the end of my paper—and these I must really credit him with not having appreciated—he apparently failed to see that the suspension of oscillations during the temporary cutting off of the supply of gas from the reservoir was due to this valve action, and offered the explanation that it was due to a synchronous, and therefore temporary blocking of the eye of the needle by a vexatious "piece of punched out skin." However, Dr. Riviere recognises that in some cases gas may fail to return from the pleural cavity through the needle, but suggests that in these cases such gas is "presumably lost among the pleural adhesions"—that is, lost where there is not even a potential cavity. The valve action of the lung seems to me to be a more satisfactory explanation. Gas having leaked into the pleural cavity and being suitably located it will be recognised that no further difficulty is likely to occur, and a subsequent puncture of the chest wall would probably furnish the desired oscillations and allow the operation to proceed satisfactorily. Hence the "misadventure" of puncturing the lung and making it leak would not be apparent and would escape detection. It is only natural, therefore, that Dr. Riviere should find difficulty in recognising and acknowledging it in his practice.

But apart from the question of puncturing the lung, Dr. Riviere criticises the use of the two manometers. I believe that a single manometer was once deemed an unnecessary complication even by pioneers in the practice of pneumothorax, so that I am not surprised that objection should be raised to the use of two. I hardly think that Dr. Riviere would raise his objections if he had had experience of a two-manometer apparatus, and his criticisms perhaps lose weight because he has not. Let us compare the methods of determining whether gas is flowing. With a two-manometer apparatus a mere glance shows immediately whether it is flowing or not. With his single manometer Dr. Riviere says that he pinches the communicating tube between the manometer and the needle—in view of the valve action, often an inadvisable procedure — to see whether the pressure in the manometer rises. This is a clumsy method, only applicable if the flow is rapid. In this connexion Dr. Riviere speaks of the pressure of gas in the gas bottle, the intrapleural pressure, and "the average pressure of the two combined," apparently not recognising that unless the tube between the manometer and gas bottle is throttled the manometer always records the pressure of gas in the gas bottle, and that the recorded pressure rises when gas ceases to flow because the head of water in the siphon has not now to drive water from the water bottle into the gas bottle. He then somewhat contemptuously denies that the gas pressure ever falls below the intrapleural. I would point out to him that just before he allows gas to flow from the reservoir this occurs with each expiration and every cough, and in consequence, if there is no valve action, gas passes freely into the manometer and produces the positive phase of the oscillation. In first operations fluid instead of gas does occasionally under these circumstances pass into the needle.

I admit that formulæ and calculations are at first sight somewhat forbidding, but only at first sight. I would do the "clinician" and "practical physician" an injustice if I suggested that they could not take two readings and from the lower of these subtract half the difference between the two. As a matter of fact, a very little practice will enable the practical physician to do this automatically as he is observing the readings. I pointed out that it was not necessary for practical purposes to work out any of the "complicated formulæ" to which Dr. Riviere objects. I also pointed out that by closing down the throttle, thereby shutting off the gas, he may, if no valve action occurs, obtain, in the same way as he does with his own apparatus, the "visual proof" of the intrapleural pressure (the reading by the direct method) which he desires. His fear that the inertia of the fluid in the small manometer reservoirs might result in the damping of the oscillations is groundless. This I have shown by placing an ordinary manometer between my apparatus and the needle; also by varying the quantities of fluid in the reservoirs. Curiously enough, the only advantage which Dr. Riviere sees—that is, the advantage regarding the range of working pressure—really does not exist. With regard to oxygen I recommend it because if it passes into the tissues it is readily absorbed and does not produce emphysema to the same extent as nitrogen sometimes does. Whether oxygen entirely eliminates the possibility of embolism I am not prepared to say. Probably, carbon-dioxide would be a better gas. However, except where gas is pumped in under considerable pressure, I believe embolism to be an overrated danger, and, with the indications of the flow and pressures which the two manometers afford and the low reservoir pressure with which I work, a negligible one.

Finally, apart from the actual method of procedure and the question whether the leakage from the lung is serious, the advantages which I claim for my apparatus are available even if the rules necessary when the single manometer is used are observed. The operation is not one to be undertaken lightly, and if the operator is not prepared to make some effort to master a slightly more elaborate apparatus, provided, of course, it is a more efficient one, he has no right to practise the method. I am, Sir, yours faithfully,

London, W., July 20th, 1914. WM. PARRY MORGAN.

To the Editor of THE LANCET.

SIR,—Dr. W. Parry Morgan's paper in THE LANCET of July 11th is a refreshing departure from the hackneyed stuff most of us have been writing on artificial pneumothorax during the last few years. But his paper leaves me scratching my head in an instinctive effort, presumably, to gouge new, mathematically-minded sulci in my cortex. More than a week's respectful contemplation of his
formulæ has left me in a state of
mystification. I do not doubt their correc

hospital from saying so. The opposition is rea
way personal. Dr. W. A. Chapple and the lad
work with him enjoy a bout at the *London*

nurses which does not harm the nurses, gives the hospital a gratuitous advertisement, and me the opportunity of replying. I fear they will leave off doing this soon. But the opposition, as I say, cannot be personal when nearly 500 matrons of hospitals and over 2000 nurses have quite recently signed the protest against it.

I am, Sir, yours faithfully,

London Hospital, E., July 21st, 1914. KNUTSFORD.

CARBOLIC ACID INJECTIONS IN TETANUS.

To the Editor of THE LANCET.

SIR,—I read with interest the description of a case of tetanus treated with subcutaneous injections of carbolic acid by Mr. W. Graham Reynolds in THE LANCET of May 23rd. I mention here a similar case which came under my observation. A native woman, aged about 45, was brought to me on May 15th last for general rigidity of the body with inability to open the mouth. Her husband, who accompanied her, told me that about 25 days previously she met with a bullock-cart accident. The wheel passed over her right foot and the edge of the ornament which she had on her right ankle cut the skin and a large wound of about three inches was made. The wound was dressed on the second day of injury. The husband stated that some six days previously to her visit to me she was unable to bend her neck and body and could not open her mouth properly.

On examination a wound was found below the internal malleolus of the right leg. The wound was about one inch long and healing, and was covered over with healthy granulations. The patient was unable to open her mouth and used to get spasms very frequently. Opisthotonos and risus sardonicus were present. There was general rigidity of the body. Her mental power was normal. The wound was washed with antiseptic lotion thoroughly well and dressed. Intramuscular injection of 2 c.c. of a 3 per cent. carbolic acid solution in distilled water was given, and the injection was repeated every four hours during the day. Daily three similar injections were given. First the injections were given in the buttocks and then in the thighs. Every time the site was changed. The patient's condition was bad for the first three days after admission. The spasms were very frequent and the patient restless. A dose of chloretone (gr. xxx.) was given every night to procure sleep and arrest restlessness. Some improvement was noticed on the fourth day; the spasms were less frequent and the restlessness was found diminished. On the fourth day the dose of injection was reduced from 2 c.c. to 1 c.c., but three injections as usual were given. From this day the symptoms began to diminish and the patient began to improve every day, though the progress was very slow. On the seventh day injections were not given and from this time no more injections were necessary. She was put on bromide and chloral mixture. From the ninth day the general rigidity and the opisthotonos began to diminish. The patient was slightly able to open her mouth on the eleventh day, and then improvement was rather rapid. On the eighteenth day after admission the movements of the neck and body were free to some extent, and the patient was able to take solid food. As the circumstances were such that she would not stay in the hospital longer she was now discharged, but I saw her daily for the next two weeks. Her progress was steady, and by the end of the fifth week she was quite well.

This was not a very severe case of tetanus, and the patient developed symptoms some time after the injury, and they were gradual in their onset. The peculiar interest in this case is that three days' treatment of nine injections brought the spasms under control (though injections were given for three days more in lesser quantities) and then her progress was slow but steady. I think more trial should be given to this method of treatment, and especially in severe cases, before coming to a definite conclusion about the usefulness of the drug.

I am, Sir, yours faithfully,

SHERALI K. NANJIANI, L.M. & S.,

Chief Medical Officer, Rewa Kantha, Chhota Udepur State.

June 24th, 1914.

⁂ Mr. Graham Reynolds's paper was supplemented in our issue of July 4th by a table of dosage.—ED. L.

To the Editor of THE LANCET.

SIR,—Mr. W. Graham Reynolds's very interesting case of recovery under carbolic acid injections, published in THE LANCET of May 23rd, has led me to analyse the results obtained at the Countess of Dufferin Hospital, Baroda, where treatment by carbolic acid injections has been our routine practice in cases of tetanus for the last two and a half years. Of the 17 cases of tetanus collected 7 died, 4 were discharged as cured, 4 as relieved, and 2 "otherwise." Of the 7 deaths recorded, Cases 3 and 13 died a few hours after admission, Case 10 two days after admission. In Cases 2 and 15 only slight temporary improvement was noted, the patients dying four days after admission. In Case 8 treatment was successful in so far as relieving the tetanic spasms, but the patient was from the start in a very debilitated condition and died from a terminal pneumonia. Case 14 was a very septic case, and died the day after lockjaw developed in the hospital. The cases marked as relieved were taken away by relatives before complete recovery (a practice which in the East one has constantly to put up with). The improvement, however, in Cases 6 and 11 was so great that they could have been classed as cured. Of the cases discharged "otherwise" no improvement at all was noted in Case 16 after 10 days' treatment, and unfortunately no further notes are available, while Case 17 was taken away the day after lockjaw developed. The number, then, is reduced to 13 of the cases in which the treatment could be said to have had a fair trial through the patients not being taken away or dying too soon. Given, then, the chance of a fair trial the treatment may be said to have been completely successful in 6 cases (Cases 1, 4, 5, 6, 11, and 12), to have effected notable improvement in 3 cases (Cases 7, 8, and 9), and slight or no improvement in 4 cases (Cases 2, 10, 15, and 16).

Considering the lateness and the general state of neglect in which most of these patients reach hospital, I think that the treatment may be said to have been subjected to a pretty severe test and to have yielded gratifying results, especially compared to the days when reliance was chiefly placed on antitetanic serum, yielding within my experience a mortality of 100 per cent. Antitetanic serum is now relegated by us to its prophylactic use, and in justice to the serum I must say that so far, and that may not be pure coincidence, no tetanus has developed in those cases which were given the prophylactic serum. In none of the cases were symptoms of carbolic poisoning noticed.

Chloretone, either per os or per rectum, was the sedative mostly employed in combination with the carbolic acid injections. A case had been reported about two years ago in which recovery from tetanus had been attributed to chloretone alone, but to my mind chloretone possesses no other specific value than that of a useful and harmless sedative. One hears of cases of recovery, sometimes singled out for publication, in which different methods of treatment have been adopted. I believe that under any method of treatment in tetanus there is a certain element of "spontaneous recovery," unfortunately occurring too seldom, but with which one has to reckon before estimating the value of a treatment uncorroborated by a series.

I am, Sir, yours faithfully,
CLIFFORD MAYER, M.D., B.S. Lond., &c.,
June 26th, 1914. Chief Medical Officer, Baroda State.

TUBERCULIN "ENTHUSIASTS."

To the Editor of THE LANCET.

SIR,—I wonder if any of your readers can do anything to check the activities of some of the tuberculin "enthusiasts." I use the word in its original sense. The following is one of several instances of their handiwork. A young woman attended the Brompton Hospital two years ago with symptoms and signs of active pulmonary tuberculosis. She had received much hospital treatment and a prolonged stay in two sanatoria, and I was able to tell her that, in my opinion, the disease was arrested and that she could return to work. She was free from symptoms, and she had neither cough nor sputum; the local signs indicated fibrosis. She was recommended to report herself periodically in any case, and to come to hospital at once if she felt ill. This was on May 14th.

I give the following account of subsequent events as it was reported to me by the patient. A few days after seeing me she received a typewritten letter from the clerk of the Insurance Committee instructing her to attend at a certain dispensary at a certain time. She did so, and was interviewed by the resident officer, who referred her to the "specialist" doctor. The latter said: "I do not know if injections will do you good or not, but we may as well try them." She received 18 injections in a short period, 14 of them on consecutive days. She returned to hospital on July 9th with a temperature of 100°F. at noon, blood-spitting and blood-stained sputum, and copious moist sounds over the affected area. It has been necessary to admit her into hospital without delay.

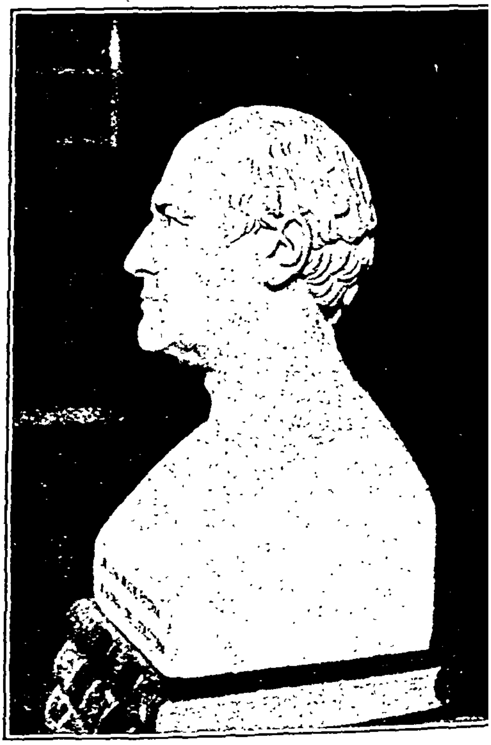
It is not my object to enter into a discussion concerning the merits—or otherwise—of tuberculin, nor to criticise the method of administration in this case. But it does seem justifiable to consider that a focus of disease, apparently arrested, was fanned into flame by the treatment. The possible sacrifice of a woman's life may not appeal to the official mind, but surely the destruction of benefits, obtained by a long and expensive treatment, will seem, even to an insurance committee, to be an achievement of which they cannot be proud.

I am, Sir, yours faithfully,
Queen Anne-street, W., July 20th, 1914. CHARLES MILLER.

WHO IS IT?

To the Editor of THE LANCET.

SIR,—After the amalgamation of the v
societies into the Royal Society of Me
the belongings of several of the dis
societies were taken out of store, and
them was found a bust which so far no or
been able to identify, nor can I find amon
officers of the dissolved societies anyone who
anything about it. It is a striking bust,
enclosed photograph bears witness—such a
should not easily be forgotten. I have
displayed in a prominent place in the
ever since the opening of our new
with a card attached to it inviting visit
identify it, but the only suggestion that has
made is that it is a bust of Dante's friend, Bru
Latini. This suggestion is based on the fac
the inscription on the bust is the description
by Dante of his friend. I do not agree wit
attribution, first, because of the style of the w
secondly, because there is in the British Mus
an illuminated manuscript containing a portra
Brunetto which does not bear the slightest re
blance to the bust; and, thirdly, because
inscription is just the kind of quotation that
one with a knowledge of Dante would wish to
scribe on the bust of an honoured teacher.



I suggest that if you publish a reproductio
the photograph identification might follow.

I am, Sir, yours faithfully,
J. Y. W. MACALISTE
Wimpole-street, W., July 17th, 1914.

*** The inscription, which cannot be deciphered
profile photograph, runs as follows:—

"La cara buona immagine paterna
Che m'insegnava come l'uom s'eterna." —E

EFERRED DEATH AFTER TRACHEOTOMY FOR LARYNGEAL DIPHTHERIA.

To the Editor of THE LANCET.

SIR.—I must thank Mr. T. Jefferson Faulder for ling attention in THE LANCET of July 18th to an parent inconsistency in my article on the above ject. The statement in question is that although overy is exceptional once obstruction develops a degree which makes extraction vital, this asure should be postponed until the obstruction omes immediately dangerous. At first thought nay seem advisable to interfere before the condition is urgent, but clinical experience does not r this out. It is better to wait, and meanwhile use *steam and the spray, which in themselves* asionally tide a patient over the critical period. rly extraction, as compared with such treatment, no more certain to avert obstruction and has its n danger. A single extraction in any stage ely gives permanent relief; forceps have to be d several times as a rule, and it can never be tain that some irritation and minor traumatic ury to the weakened mucous membrane may not ult—conditions which favour a more rapid forman of the plug. Hence I regard extraction as a last ource. All that can be claimed for it is that it ll postpone death in many cases, and offers a ance of recovery when a fatal issue is otherwise evitable. Whether any variation of the method uld improve the prognosis is an important estion on which limited investigation at Plaistow spital throws no light. At best the gain is likely be small, since behind the tracheal obstruction ere is, in the majority of instances, a grave type lobular pneumonia. I have no experience of e bronchoscope, and cannot foresee its rôle this connexion, but as Mr. Faulder has dly suggested its use I hope to test its ssibilities in due course.

I am, Sir, yours faithfully,

mpole-street, W., July 19th, 1914. JOHN BIERNACKI.

THE SCHOOL MEDICAL SERVICE.

To the Editor of THE LANCET.

SIR,—One still occasionally hears the gibe against hool medical officers who are busy forming themlves into a group for the discussion of their culiar interests, scientific and sociological (and I resay it is said of the tuberculosis officers also o are doing the same thing) that it is only a ovement of *discontented* juniors bent on forcing their own salaries.

Now there is no doubt that an increase of salary s a perennial interest for most of us, but this es not entirely explain the agitation. The fact specialised services like the *school* medical rvice are more and more *feeling* the need of ing self-contained and self-feeding. We shall t in future be able to staff the lower ranks with ere transitional young people on their way to neral practice or other departments of the public edical service for which, indeed, experience in hool work very imperfectly fits them. The ideal the future must be that of a Civil Service, in hich even the lower grades of responsible workers ust have a living wage, so that if they go no igher their lives will not have *been* a disastrous ilure.

I am, Sir, yours faithfully,

[illegible], July [illegible], 1914. JOHN PRIESTLEY.

THE WORKING OF THE NATIONAL INSURANCE ACT IN GREAT YARMOUTH.

To the Editor of THE LANCET.

SIR,—It is nonsense for Dr. H. Blake, Mr. J. I. Sankey, and Dr. Y. H. Blake, of Yarmouth, to write in THE LANCET of July 18th about "the British Medical Association breaking its side of the pledge." When Dr. J. R. Ratcliffe, of Birmingham, stated last year, at the annual representative meeting at Brighton, that the organisation of the Association had broken down, the chairman of the council very rightly objected to the statement, and said it was the individual members of the Association who had broken down, and that until they could get members of the Association to be loyal to the organisation nothing could be effected.

It is now known that the members of the medical profession cannot be trusted to stand by their words. What can we expect, then, but "trouble upon trouble," and the saddest part of it all is that many men do not seem to realise what they have done.

I am, Sir, yours faithfully,

Woodbridge, Suffolk, July 19th, 1914. T. CUMING ASKIN.

THE POSITION OF THE ASSISTANT MEDICAL OFFICERS OF THE METROPOLITAN ASYLUMS BOARD.

To the Editor of THE LANCET.

SIR,—I see from your issue of July 18th that the Metropolitan Asylums Board are advertising for assistant medical officers at a new rate of salary. There has been a good deal of dissatisfaction in this service for some time past, and lately an association of assistant medical officers was formed which petitioned the managers for a redress of many grievances, of which the rate of salary was only one. No reply has yet, I understand, been received to this petition, and pending such reply the association is precluded from publishing the correspondence. Intending applicants would therefore, I am sure, be consulting their own interests by finding out from the secretary of the association (Dr. E. G. Goffe, the North-Eastern Hospital, St. Ann's-road, Tottenham, N.) what these grievances are, and how they have been dealt with, before deciding to apply.

I am, Sir, yours faithfully,

JOHN H. TRENCH, M.B. Cantab.

Edgbaston, July 20th, 1914.

CHILD MORTALITY AND ALCOHOLISM IN PARIS.

To the Editor of THE LANCET.

SIR,—May I call attention to the report from your Paris correspondent in THE LANCET of July 11th of a statement of M. Paul Juillerat and M. A. Filassier, in which they do not hesitate to attribute to alcoholism in the parents this enormous proportion of children affected with congenital debility, accounting for 12,342 deaths. This statement is so contrary to the findings of Professor Karl Pearson, F.R.S., and Miss Ethel M. Elderton (Galton research scholar)—viz.: "The mean weight and height of the children of alcoholic *parents are slightly greater than* those of sober parents, but as the age of the former children is slightly greater, the correlations when corrected for age are slightly positive—i.e., there is slightly greater height and weight in the children of the sober. In the case of the father the correlations are not significant, having regard to their probable error; in the case of the mother they may be just significant, but they are so slight as to have no importance."

My practical clinical experience entirely endorses these scientists' findings. A few years ago I was surprised to find out of a large number of mothers visited in the Hoxton district what strong, well-developed infants these mothers had, although I knew that they were addicted to alcohol in excess. This difference between scientists requires more than a passing notice, and I trust that Professor Karl Pearson will reply to M. Juillerat and M. Filassier for the benefit of all impartial medical practitioners. I am, Sir, yours faithfully,

New Cavendish-street, W., July 18th, 1914. THOMAS DUTTON.

Medical News.

UNIVERSITY OF CAMBRIDGE.—The following medical degrees have been conferred:—

M.D.—F. R. Martin.
M.C.—W. S. Perrin, Caius.
M.B., B.C.—P. Stocks, King's; H. P. Dawson, Trinity; G. Askey, St. John's; and T. L. Hardy, Selwyn.
M.B.—F. E. W. Rogers, Emmanuel.
B.C.—H. Hartridge, King's; W. B. Gordon, Clare; W. F. B. Smith, Pembroke; J. W. Pigeon, Christ's; C. Mackenzie, Emmanuel; and R. A. Thacker, Downing.

UNIVERSITY OF BRISTOL.—At examinations held recently the following candidates were successful:—

SECOND EXAMINATION FOR THE DEGREES OF M.B., CH.B.
Edwin Jennings Ball, Reginald Bertram Britton, Norman Durant, Frederick Viel Jacques, and Ronald Henry Tasker.

FINAL EXAMINATION FOR THE DEGREES OF M.B., CH.B.
Part I. only.—Oliver Charles Minty Davis.

SECOND EXAMINATION FOR THE DEGREE OF B.D.S.
William John Langford.

DIPLOMA IN PUBLIC HEALTH.
William Teulon Torrance.
Part II. (completing examination).—John Richard Kay-Mouat.

SECOND EXAMINATION FOR THE DIPLOMA IN DENTAL SURGERY.
Roy Lugarde O'Sullivan.

UNIVERSITY COLLEGE, LONDON.—Mr. T. B. Johnston, M.B., Ch.B. Edin., lecturer on anatomy in the University of Edinburgh, has been appointed to the newly created office of lecturer and demonstrator in anatomy at University College, London.

UNIVERSITY OF LIVERPOOL.—Mr. John Smyth Macdonald, professor of physiology in the University of Sheffield, has been appointed to the Holt chair of Physiology in the University of Liverpool, vacated by Professor C. S. Sherrington.

VICTORIA UNIVERSITY OF MANCHESTER.—At examinations recently held the following were awarded certificates in School Hygiene and in Factory Hygiene:—G. D. Dawson, M.B., Ch.B., and W. M. MacIlraith, L.R.C.P., L.R.C.S.

IRISH MEDICAL SCHOOLS' AND GRADUATES' ASSOCIATION.—The summer general meeting and luncheon of this association will take place at the Grand Hotel, Aberdeen, on Wednesday next, July 29th, at 1.15 for 1.30 o'clock.

UNIVERSITY OF LONDON.—A meeting of the Senate was held on July 15th, Sir Wilmot Herringham, the Vice-Chancellor, being in the chair. It was resolved in response to a request from the Board of Control to suggest the following conditions for the grants allotted to the board by the Treasury encouraging scientific research into the causes and treatment of mental diseases and mental defect: (1) individual grants to be made to a few observers who have been thoroughly trained and who are capable of carrying out scientific investigations; (2) no grant under the scheme to be made merely to maintain or assist pathological laboratories or to be given to persons for the purpose of routine work; (3) grants to be given only to advance the study of fundamental problems connected with insanity and mental deficiency. It was further resolved to inform the Board of Control that the Senate would be pleased to advise them as to the objects towards which investigations thus aided might with most advantage be directed.

BRISTOL GENERAL HOSPITAL.—The president of the hospital, Mr. George Alfred Wills, will open the new wing and pathological laboratory on Monday next, July 27th, at 3.30 P.M.

MEDICAL MAGISTRATES.—The following Hull practitioners have been made justices of the peace for the city: Dr. Frank Nicholson, senior physician, Hull Royal Infirmary; Dr. George Gantby, ex-sheriff of Hull; and Mr. C. H. Milburn.

GLASGOW ROYAL INFIRMARY: POST-GRADUATE CLASSES.—Autumn post-graduate classes in clinical medicine, surgery, and gynæcology, and in the various special departments, will be held at the infirmary during the month of September. Full particulars may be obtained from the superintendent, Dr. J. Maxtone Thom.

BRITISH SCIENCE GUILD.—At the last meeting of the executive committee of the guild a special committee, with Sir Norman Lockyer as chairman, was appointed to report upon various matters connected with science and the State and the encouragement of discovery which were referred to by Sir Ronald Ross in his address delivered at the annual meeting of the guild in May last.

THE trustees of the *American Medicine* Gold Medal have awarded the medal for 1914 to Dr. George W. Crile as the American doctor who in their judgment "has performed the most conspicuous and noteworthy service in the domain of medicine and surgery during the past year."

ST. GEORGE'S HOSPITAL.—The annual dinner of the St. George's Hospital Medical School will be held at Prince's Restaurant, Piccadilly, on Thursday, Oct. 1st, at 6.30 for 7 o'clock, when the Right Hon. Sir Gerard Lowther, joint treasurer of the hospital, will take the chair. The annual introductory address will be delivered on the same day at 3 P.M. in the hospital by Mr. A. E. Shipley, F.R.S.; Master of Christ's College, Cambridge.

DONATIONS AND BEQUESTS.—A further gift of £10,000 has been made to Cardiff Medical School by the anonymous donor who has previously made donations equivalent to £90,000.—Mr. Lynn Thomas, on giving up private practice, has presented to King Edward VII. Hospital, Cardiff, his local private hospital for paying patients, the value of the gift being estimated at £4000

SOUTH-WEST LONDON MEDICAL SOCIETY.—At the annual meeting of this society on July 8th the following were elected as office-bearers for the 1914–15 session:—President: Dr. W. D. Murray. Treasurer: Dr. C. J. Martin. Secretaries: Mr. R. F. Chance and Mr. H. B. A. Pearson. Librarian: Dr. C. J. Martin. Council: Dr. E. H. Brock, Dr. G. F. Hugill, Dr. G. Ross Laing, Surgeon-Major M. Robinson, and Dr. C. M. Young.

MEDICAL SICKNESS AND ACCIDENT SOCIETY.—The usual monthly meeting of the executive committee of this society was held at 429, Strand, W.C., on July 17th, Dr. F. J. Allan being in the chair. The half-yearly balance-sheet submitted to this meeting showed that the society's reserves continue to expand. The funds amount to over £260,000, and the income of the society is well over £35,000 per annum and shows a steady rise every year. The grateful letters from members who attain the age of 65 and receive their bonus are highly satisfactory to those under whose careful management the society has prospered sufficiently to enable this bonus to be paid, and the amount actually paid increases every year, and reached £1500 in 1913. This fact proves that many attain 65 years, and that insured medical men are, taken as a whole, good lives. The claim account presented was slightly lower than that of last year and was under the expectation provided for by the tables. The new business report was good and shows an increase over that for the same month of the preceding year. A prospectus and all information can be obtained from the secretary, 33, Chancery-lane, London, W.C.

Obituary.

THE RIGHT HON. SIR CHRISTOPHER NIXON, BART., P.C., D.L., LL.D., M.D. DUB., F.R.C.P. IREL.,

VICE-CHANCELLOR OF THE NATIONAL UNIVERSITY OF IRELAND; PAST PRESIDENT OF THE ROYAL COLLEGE OF PHYSICIANS OF IRELAND.

THE death of Sir Christopher Nixon occurred on Sunday, July 19th, at his residence, Roebuck Grove, Co. Dublin, at the age of 64 years. He had been seriously ill with disease of the heart for several months past, and it was known that his chance of ultimate recovery was small. Nevertheless, his death came as a surprise to all except his intimate friends.

SIR CHRISTOPHER NIXON.
(Photo by Lafayette, Dublin.)

Sir Christopher Nixon received his education at Trinity College, Dublin, and the Catholic University School of Medicine. He obtained the Licences of the Royal Colleges of Ireland at an early age, subsequently graduating B.A. and M.B. of Dublin University. He then studied for some years in Paris. On his return to Ireland he was appointed professor of anatomy and physiology in the Catholic University School of Medicine in Cecilia-street. This post did not occupy his entire time, and his appointment as physician to the Mater Misericordiæ Hospital gave him scope for his clinical abilities. To these two institutions and to the interests that arose out of them he gave the best of his life-work. To his gifts as a teacher both owed much, and for years he enjoyed the reputation of being the best clinical instructor among Dublin physicians. He soon changed the chair of anatomy for that of medicine, and his professorial lectures on that subject were attended by students from all the Dublin schools. As time passed his reputation as a practising physician became as great as his reputation as a teacher. Success came to him early, but this did not lead him to take his work lightly or to neglect self-improvement. Up to the failure of his health a year or two ago he took the utmost pains in the preparation of his clinical lectures. He carefully selected his cases for demonstration, and he made a habit of devoting the evening before his lecture to the perusal and even close study of the clinical notes of the cases selected, so that everything might be in order for his lecture. The same care distinguished the systematic course which it was his duty as professor of medicine to deliver. In such careful, honest teaching in the hospital and the school, and careful, honest work in the ward and the consulting-room, Nixon's purely professional activities were mainly expended. He found little time for writing. In his earlier days, indeed, he published several papers which showed not only accurate study but originality of thought. He wrote one book, "Handbook of Hospital Practice and Physical Diagnosis," which was published in 1889. Books on diagnosis are now plentiful enough, but a quarter of a century ago Nixon might fairly be regarded as a pioneer. The book was excellent for its purpose, clear, lucid, terse, and it proved its utility to many successive generations of students. It is to be regretted that lack of time prevented his revising it and bringing it into touch with current knowledge. In his clinical work Nixon took chief interest in the diseases of the heart—a fact which leads inevitably to the recollection that some of the most able students of, and trustworthy authorities on, diseases of the heart have themselves been sufferers from cardiac trouble. To go no further, we may add to Nixon, of Dublin, the names of Gairdner, of Glasgow, and Gibson, of Edinburgh.

Sir Christopher Nixon's teaching duties, together with his hospital work and large private practice, would have been to most men sufficient occupation, but, as a matter of fact, for many years past his extra professional activities occupied a large part of his time and thought. He took a great interest in the development of his school and hospital, and his power of organisation and business ability played an important part in leading to the success which has crowned the work of both these institutions. He felt keenly that his co-religionists in Ireland suffered some inequality in the matter of university education, and therefore he threw himself warmly into the working of the Royal University. At a later date he was active in the work which led up to the establishment of the National University, of which he became the first Vice-Chancellor. He was one of the first to take up warmly the question of establishing a veterinary college for Ireland. His efforts were successful, and when the Royal Veterinary College of Ireland was founded he was appointed first president. In addition to the posts already mentioned, he held several of the medical posts of importance. He was

personality, at once genial and kindly. He was a foreign member of the Royal Society, an LL.D. of the four Scottish Universities—Aberdeen, Edinburgh, Glasgow, and St. Andrews—as well as D.Sc. of Cambridge. Physiology is vastly the poorer for his death, and his friends will ever keep green the memory of this amiable, accomplished, genial, and erudite physiologist.

THE NATIONAL INSURANCE ACT.

THE WORKING OF THE ACT.

EXPERIENCE that is long enough to be of some service is now accumulating in respect of the working of the Act. With regard to the supply of drugs and appliances, for example, the settlement of the 1913 accounts discloses, as all our readers know, some heavy deficits. A discussion on the subject will be found in a leading article in THE LANCET of June 27th. The Commissioners have been considering steps to obviate the anticipated recurrence of similar deficits in the current year. At a conference with the medical and pharmaceutical members of the Advisory Committee the causes of these deficits were carefully considered, and the conclusion, we believe, was arrived at that a substantial part of the deficits could be traced to the lax methods of prescribing of a few practitioners. The Pharmaceutical Society is anxious, we know, not to attribute too much of the present situation to over-prescribing, and it must be remembered that the cost of the supply of drugs may sometimes have caused the deficits, while, of course, in certain areas the varying incidence of sickness must lead to extraordinary expenses. Lancashire was selected by the Pharmaceutical Society as the area in which to make an inquiry into the matter from the chemists' point of view, but a conference between insurance, panel, and pharmaceutical committees in that county has not resulted so far in any definite suggestions.

The safeguards against lax or excessive prescribing are contained in Article 40 of the Regulations under which a Pharmaceutical Committee by making representations to a Panel Committee may require the latter committee to investigate and report on the subject to the Insurance Committee concerned, and this last body can surcharge the practitioners responsible for the excess. We do not know how often Pharmaceutical Committees have made the necessary representations to Panel Committees, but the Panel Committees have failed to put machinery into operation. The responsibility for the situation appears, therefore, to lie to some extent at the door of the panel practitioners, but we can understand that they may find the *métier* of informer a very difficult and unpleasant one to exercise. This difficulty, we are informed, has been recognised by the Advisory Committee, and their recommendations to the Commissioners may result in some readjustment of the financial machinery of the Act. It seems that this is all the more necessary, inasmuch as a Panel Committee, though the only one of the three statutory bodies interested which can control prescribing is the particular one which is the least interested in the task of control, and more and more as the division between medical practice and the making up of prescriptions becomes pronounced will this position become confirmed. The Advisory Committee have advised the Commissioners that it is undesirable that panel practitioners should have a direct financial interest in the business of chemists on the panel in the same neighbourhood, and the probability is that the use by doctors of chemists' shops as surgeries or consulting-rooms will gradually decline.

Other matters which may call for revision of the Medical Benefit Regulations, and which were recently discussed between the Commissioners and the members of the Advisory Committee, included the procedure in regard to complaints by insured persons of the professional services of panel practitioners and the question of the utilisation of new machinery, such as medical refereeing and laboratory facilities, to the best advantage. It is a gratifying circumstance to note that the number of complaints against panel practitioners has been small and also that the character of these complaints has mostly been unimportant; but it is a fact that the existing machinery for dealing with offenders, whose errors are not sufficiently grave perhaps to warrant representations with a view to removal from the panel, is not satisfactory. For the good of the whole medical profession some of these lax practitioners ought none the less to receive some more effective check than a warning in which no publicity is given to their names, for undoubtedly the protection afforded by anonymity is almost complete. On the other hand, the punishment suggested by publication of names would be very great, and we can conceive grave hardship to follow any unfortunate error. The fact is that Insurance Committees would be well advised to shift the responsibility in really bad cases on to the shoulders of the General Medical Council. Where Insurance Committees are in full possession of facts which point to professional misbehaviour we think that it would be for the good of the public, of our calling, and of the panel service alike, if the cases were brought before the disciplinary body of the profession.

MR. MASTERMAN AND THE PHARMACEUTICAL SOCIETY.

Mr. Masterman, as chairman of the National Health Insurance Commissioners, together with some of his colleagues on the Commission, received a deputation from the Pharmaceutical Society on the subject of the insufficiency of the drug funds in several localities to pay in full the druggists who have undertaken to make up prescriptions under the Insurance Act. Mr. Edmund White, President of the society, on behalf of the deputation, spoke of the funds as being sufficient in about 150 areas out of 196, and of the deficiency where it existed as varying from 3 to 30 per cent. He referred to the high sickness rate among insured women as a contributing cause, and to the receipt of ordinary medical benefit by tuberculous patients who should be receiving sanatorium benefit as another. He said that the agreement by druggists to allow a discount when necessary had been entered into in error, and he urged that the profits on accounts were too small to allow any margin for discounts. Mr. Masterman, in reply, said that the conditions as to discount on druggists' accounts could not be reconsidered until the existing Regulations had been fully utilised. The Government had a small fund wherewith to meet the contingency of excessive sickness, but it was not intended to meet a demand due to excessive prescribing. He recognised that Pharmaceutical Committees in some areas were exercising their visiting physician to Dundrum Criminal Lunatic Asylum and to the College of Maynooth, and he was consulting physician in lunacy to the High Court of Chancery. Since the establishment of University College, Dublin, as a constituent college of the National University, he occupied its chair of medicine. He represented the Royal University, and more recently the National University on the General Medical Council. He was President of the Royal College of Physicians of Ireland. and was physician to more than one Viceroy of Ireland, including the present Lord-Lieutenant, Lord Aberdeen.

Many public honours came to him. He was a magistrate and a deputy lieutenant for the county of Dublin. In 1885 the Royal University conferred on him the degree of M.D. *honoris causâ*, and in 1912, on the occasion of the bicentenary celebrations of the medical school of Trinity College, he received a similar honour from his *alma mater*. In 1895 he received the honour of knighthood, and in 1906 he became a baronet of the United Kingdom. Within the present year his name was added to the list of His Majesty's Privy Council in Ireland. He married in 1872 Mary Agnes, daughter of Dominick Edward Blake, of Castlegrove, county Galway, by whom he had issue one son and three daughters.

Sir Christopher Nixon performed an enormous amount of public work with ability and assiduity. He was a physician of skill and learning, and a teacher of the first order. It may be regretted by his friends that he did not find time to give to a wider audience, by means of his pen, the wealth of learning which he lavished on his class of students. That he could have increased his reputation by writing more is certain, but had he done so, much of what he actually accomplished must have been left undone. His was a fine practical career.

TWO DISTINGUISHED PHYSIOLOGISTS.

(FROM A CORRESPONDENT.)

THE physiological world has had to deplore recently the loss of two of its most distinguished continental representatives, Professor Dr. Ludimar Hermann, who for many years occupied with such *éclat* the chair of physiology in the University of Königsberg, and Professor Kronecker, professor of physiology in the University of Berne.

Dr. Ludimar Hermann was born in Berlin on Oct. 31st, 1838. He attended the university and took his degree in 1859, and afterwards as *privat-docent* dedicated himself to physiology in his native city. In 1868 he was called to Zürich as professor ordinarius of physiology, and reference to Pflüger's Archiv and Poggendorff's Annalen shows how active and fertile were both his brain and pen. Many of his contributions to physiology showed a distinctly physical bias, while some were largely chemical. Those physiologists who are old enough to recall the elaborate and vastly unsatisfactory theories of Professor du Bois Reymond, of Berlin, by way of explaining the "muscle current," the "nerve current," and the so-called "negative variation," may also recall how, as it were, with one illuminating suggestion Hermann swept away all this theorising. To-day Hermann's theory of the muscle current holds the field. Not the least of Hermann's services to physiology and to medicine in general is that he in 1863, along with von Recklinghausen, W. Kühne, and Ph. Munk, founded the *Centralblatt für die Medicinischen Wissenschaften*, the parent of *Centralblatts* galore. His "Grundriss der Physiologie," written in a terse, didactic style, ran into many editions, and two of these editions (fifth and sixth) were translated into elegant English by the late Professor Arthur Gamgee. It was also translated into several other languages. Following the idea of the first classic German "Handwörterbuch der Physiologie" (1842-53) and Todd and Bowman's "Cyclopedia of Anatomy and Physiology," Hermann edited as well as contributed to his well-known "Handbuch der Physiologie" which bears his name, and in which some of the epoch-marking contributions to physiology during the latter part of last century may still be read with profit. His "Lehrbuch der Allgemeinen Toxikologie" (1874) was a notable contribution to this subject in these now, alas, far-off days. In 1884 Hermann was called to succeed the versatile von Wittich in the Northern Prussian University of Königsberg, where for many years he added greatly by his contributions to the advancement of that science to which he had dedicated the highest efforts of his intellect. At this time when attacks are made against what is called "vivisection" in this country, it may not be amiss to recall that Hermann published a pamphlet, which was translated into English in 1877 by A. Dickson, of Edinburgh, under the title "The Vivisection Question Popularly Discussed," the original German title being somewhat more terse, to wit, "Die Vivisectionsfrage."

In Berne one day after the death of Hermann Dr. Hugo Kronecker, professor of physiology in the University of Berne, died. Hugo Kronecker was born in Liegnitz in Silesia in 1839. He studied in Heidelberg under Helmholtz and also in Berlin, and graduated in Berlin in 1863; his dissertation dealt with muscular fatigue. As private assistant to the world-renowned physician Traube, Kronecker acquired an intimate knowledge of practical medicine, which served him in good stead as an army surgeon during the campaigns of 1866 and 1870–71. For his services he was rewarded with the decoration of the Iron Cross. He also carried out chemical investigations under Willy Kühne, and in 1868 he went to Leipsic and became assistant to, as well as one of the most esteemed pupils and friend of, Carl Ludwig. He was *privat-docent* in 1872 in Leipsic, and his dissertation "On the Fatigue and Recovery of Cross-striped Muscle" became famous. In 1875 he was elected professor extraordinarius; in 1877 he was called to Berlin; and in 1885 he became professor in Berne, and was thus in the line of succession of the great Haller himself. He liked to call his institute the "Hallerianum." For some years along with Senator he edited the *Centralblatt für die Medicinischen Wissenschaften.* Kronecker's scientific activity was many-sided and catholic in its scope. His studies on muscle form the basis of our knowledge of the laws of muscular fatigue. He discovered that during the first part of a cardiac contraction the heart is inexcitable to stimuli, a phenomenon also discovered by Marey, and by him called the "refractory period." Kronecker's point in the heart is well known, and so are his researches on excised surviving organs, more especially the heart, uterus, and vagina. Reflex action, respiratory movements, swallowing of fluid, vaso-motor centre, sources of animal heat, the action of cardiac poisons, and many other subjects were studied by himself and his numerous pupils. Later in life he made important studies on the effects of rarefied air on the circulation, which have borne important practical results more especially in the process of tunnelling through mountain masses. Kronecker stood in the front rank of physiologists, and his influence on physiology was far greater than might be inferred from the list of papers published under his own name. Like his great master, C. Ludwig, much of the work he inspired was published in the names of his pupils. Everything he did was thorough, and because he had an almost encyclopædic knowledge he was able to give every question he handled an appropriate historical setting. He gave to all his co-workers and pupils "without money and without price" the benefits of his rich stores of knowledge. He was a most lovable, amiable, and generous-hearted man. He was an accomplished linguist, almost a polyglot. In Ludwig's laboratory he could be heard enlightening the latest Italian arrival, who knew no German, in accents as elegant as those spoken by any true-born son of Italy.

All who knew Kronecker—and his friends were legion—became attached to him, for he had a gracious winning personality, at once genial and kindly. He was a foreign member of the Royal Society, an LL.D. of the four Scottish Universities—Aberdeen, Edinburgh, Glasgow, and St. Andrews—as well as D.Sc. of Cambridge. Physiology is vastly the poorer for his death, and his friends will ever keep green the memory of this amiable, accomplished, genial, and erudite physiologist.

THE NATIONAL INSURANCE ACT.

THE WORKING OF THE ACT.

EXPERIENCE that is long enough to be of some service is now accumulating in respect of the working of the Act. With regard to the supply of drugs and appliances, for example, the settlement of the 1913 accounts discloses, as all our readers know, some heavy deficits. A discussion on the subject will be found in a leading article in THE LANCET of June 27th. The Commissioners have been considering steps to obviate the anticipated recurrence of similar deficits in the current year. At a conference with the medical and pharmaceutical members of the Advisory Committee the causes of these deficits were carefully considered, and the conclusion, we believe, was arrived at that a substantial part of the deficits could be traced to the lax methods of prescribing of a few practitioners. The Pharmaceutical Society is anxious, we know, not to attribute too much of the present situation to over-prescribing, and it must be remembered that the cost of the supply of drugs may sometimes have caused the deficits, while, of course, in certain areas the varying incidence of sickness must lead to extraordinary expenses. Lancashire was selected by the Pharmaceutical Society as the area in which to make an inquiry into the matter from the chemists' point of view, but a conference between insurance, panel, and pharmaceutical committees in that county has not resulted so far in any definite suggestions.

The safeguards against lax or excessive prescribing are contained in Article 40 of the Regulations under which a Pharmaceutical Committee by making representations to a Panel Committee may require the latter committee to investigate and report on the subject to the Insurance Committee concerned, and this last body can surcharge the practitioners responsible for the excess. We do not know how often Pharmaceutical Committees have made the necessary representations to Panel Committees, but the Panel Committees have failed to put machinery into operation. The responsibility for the situation appears, therefore, to lie to some extent at the door of the panel practitioners, but we can understand that they may find the *métier* of informer a very difficult and unpleasant one to exercise. This difficulty, we are informed, has been recognised by the Advisory Committee, and their recommendations to the Commissioners may result in some readjustment of the financial machinery of the Act. It seems that this is all the more necessary, inasmuch as a Panel Committee, though the only one of the three statutory bodies interested which can control prescribing is the particular one which is the least interested in the task of control, and more and more as the division between medical practice and the making up of prescriptions becomes pronounced will this position become confirmed. The Advisory Committee have advised the Commissioners that it is undesirable that panel practitioners should have a direct financial interest in the business of chemists on the panel in the same neighbourhood, and the probability is that the use by doctors of chemists' shops as surgeries or consulting-rooms will gradually decline.

Other matters which may call for revision of the Medical Benefit Regulations, and which were recently discussed between the Commissioners and the members of the Advisory Committee, included the procedure in regard to complaints by insured persons of the professional services of panel practitioners and the question of the utilisation of new machinery, such as medical refereeing and laboratory facilities, to the best advantage. It is a gratifying circumstance to note that the number of complaints against panel practitioners has been small and also that the character of these complaints has mostly been unimportant; but it is a fact that the existing machinery for dealing with offenders, whose errors are not sufficiently grave perhaps to warrant representations with a view to removal from the panel, is not satisfactory. For the good of the whole medical profession some of these lax practitioners ought none the less to receive some more effective check than a warning in which no publicity is given to their names, for undoubtedly the protection afforded by anonymity is almost complete. On the other hand, the punishment suggested by publication of names would be very great, and we can conceive grave hardship to follow any unfortunate error. The fact is that Insurance Committees would be well advised to shift the responsibility in really bad cases on to the shoulders of the General Medical Council. Where Insurance Committees are in full possession of facts which point to professional misbehaviour we think that it would be for the good of the public, of our calling, and of the panel service alike, if the cases were brought before the disciplinary body of the profession.

MR. MASTERMAN AND THE PHARMACEUTICAL SOCIETY.

Mr. Masterman, as chairman of the National Health Insurance Commissioners, together with some of his colleagues on the Commission, received a deputation from the Pharmaceutical Society on the subject of the insufficiency of the drug funds in several localities to pay in full the druggists who have undertaken to make up prescriptions under the Insurance Act. Mr. Edmund White, President of the society, on behalf of the deputation, spoke of the funds as being sufficient in about 150 areas out of 196, and of the deficiency where it existed as varying from 3 to 30 per cent. He referred to the high sickness rate among insured women as a contributing cause, and to the receipt of ordinary medical benefit by tuberculous patients who should be receiving sanatorium benefit as another. He said that the agreement by druggists to allow a discount when necessary had been entered into in error, and he urged that the profits on accounts were too small to allow any margin for discounts. Mr. Masterman, in reply, said that the conditions as to discount on druggists' accounts could not be reconsidered until the existing Regulations had been fully utilised. The Government had a small fund wherewith to meet the contingency of excessive sickness, but it was not intended to meet a demand due to excessive prescribing. He recognised that Pharmaceutical Committees in some areas were exercising their powers with regard to the supervision of prescriptions, and urged the Pharmaceutical Society to influence Pharmaceutical Committees to do the same. The matter concerned these and also Panel Committees and Insurance Committees. If the druggists later on satisfied him that the committees had used their utmost efforts under the Regulations, and that nothing had been done by way of surcharging the medical men responsible, a new situation would have arisen with which the Commissioners and the Government would have to deal. Upon the information before him he thought there were grave discrepancies between the cost of prescriptions in different areas and as between individual medical men. He thought these differences must in some cases be due to laxity on the part of a small number of individual medical practitioners. It appeared to him that the time had come to have the tariff for drugs examined by a Departmental Committee, and he would take account of the suggestions made by the deputation.

THE SANITARY CONGRESS AND NATIONAL INSURANCE.

At the twenty-ninth annual Congress of the Royal Sanitary Institute interesting references to the working of the National Insurance Act were made by many speakers. Dr. James Niven, medical officer of health of Manchester, said that it would not be claimed that the Act had produced any great immediate effect on public health administration except as regards tuberculosis, but it promised to do so. It had not hitherto diminished the difficulty of obtaining enough medical practitioners for poor areas to enable patients to receive the time and attention necessary. A State service by whole-time medical officers paid by salaries to attend a definite number of patients was a remedy suggested which was growing in favour. The public health staff had felt the strain of sanatorium benefit work added to their duties, and other public health work had to some extent suffered, but this difficulty was a temporary one only. Dr. Meredith Young spoke of the results of the Act in procuring the early diagnosis of such diseases as Bright's disease, cancer, and heart disease as not so far satisfactory, and Dr. Alfred Greenwood, medical officer of the Kent county council, described institutional treatment under the Act as not having had a fair chance of showing good results, as few sanatoriums as yet had been able to treat any large number of the early cases for which they were intended. In the course of a discussion upon the housing question some vigorous and suggestive observations were made by Dr. J. Holroyde upon the responsibility of the slum dweller for the conditions in which he lived, and upon "lazy and dirty tenants being allowed to be nuisances and breeders of disease, and to go unpunished" as such. He spoke of the slum dweller as unworthy, in the majority of instances, of the "sentimental utterances of a certain type of social reformer whose fetish was the 'liberty of the subject.'" Alderman J. W. Midgley said that the greatest difficulty was not in compelling owners to put their property in a sanitary condition, but in compelling the occupiers to keep it so.

THE LIFE ASSURANCE MEDICAL OFFICERS' ASSOCIATION AND THE ACTS.

A communication has been issued by the secretary of the Life Assurance Medical Officers' Association announcing the intention of the association to extend the scope of its work in order to include all medical questions connected with assurance. The next meeting of the association will be held in November, and will be devoted to a discussion on the Certification of Incapacity under the National Insurance Act. The honorary secretaries are Dr. R. A. Young, 57, Harley-street, W., and Dr. Otto May, 19, Well-walk, Hampstead, N.W.

BLACKBURN INSURANCE COMMITTEE.

At the quarterly meeting of the Blackburn Insurance Committee it was reported that the amount due to medical men on the panel for the year was £20,156, of which £19,644 had been paid, and of which the balance, r senting money accumulated in respect of unallotted in persons, would be divided among the practitioners o panel in proportion to their lists. In consequence of a of over-prescribing being made by the Pharmaceutical mittee it was resolved to go through all prescription calculate in respect of each medical man on the the average price of prescriptions given by him, average number of prescriptions issued per person, average cost of drugs ordered, and also the averages fo same matters over the whole area. A letter was rec from the Commissioners calling attention to the d bility of reminding medical men to comply with conditions necessary for the protection of the drug fund

DUNDEE INSURANCE COMMITTEE: PRIVACY IN CAS OF COMPLAINTS.

At a meeting of the Dundee Burgh Committee held week the suggestion of the Medical Subcommittee o Dundee Insurance Committee—viz., that "the nam persons concerned with cases of complaint reported o the Medical Service Subcommittee shall not be printe the reports of such committee, and the persons conce shall only be referred to in any discussion in the Insur Committee as 'the patient' and 'the doctor,' or such terms as will assure that identification is impossible"— under discussion. The chairman of the Medical Se Subcommittee wrote that he considered the motion *vires*, because the Commissioners had issued regulation which the proceedings of the subcommittee were regula and unnecessary because these regulations prescribed the proceedings of the subcommittee were to be priv So far as he knew that condition had always been obser and no name, either of the insured person or of the doc had appeared in any of the subcommittee's rep Eventually the previous question received 16 votes t for the Medical Committee's motion.

Parliamentary Intelligence.

NOTES ON CURRENT TOPICS.

The Fate of Bills.

MR. ASQUITH, on Friday, July 17th, made a statement c cerning the Bills with which the Government propose proceed this session and those which they would aband In the list of the abandoned measures are the Direct Re sentatives of the General Medical Council Bill, the H (Substitutes) Bill, and the Naval Medical Compassion Fund Bill. Amongst the Bills which the Government h to pass are the Milk and Dairies Bill, the Milk and Dair (Scotland) Bill, the Inebriates Bill, and the Elementa Education (Defective and Epileptic Children) Bill. The la mentioned measure was read a third time in the House Commons on Friday, July 17th.

Asylum Officers' Superannuation Act.

Some negotiations have been taking place with the Ho Secretary in regard to the amendment of the Asylu Officers' Superannuation Act. A private Member's Bill this subject was introduced into the House of Commons th session, but it has not in all respects been acceptable to t Home Office.

Midwives (Scotland) Bill.

One amendment of substance has been introduced into th Midwives (Scotland) Bill which came before the Standi Committee on Scottish Bills of the House of Commons o Wednesday, July 22nd. Clause I., amongst its other pr visions, laid down that after Jan. 1st, 1921, "no woman sh attend women in childbirth otherwise than under th direction of a registered medical practitioner unless sh be certified under this Act." This provision was wid than the corresponding provision in the English Ac The prohibition there is that "no woman shall habit ally and for gain attend," &c. In order to meet certa opposition in the House of Commons an arrangeme was come to that the more restricted phraseology o the English statute should be introduced into the Bi in committee. Mr. BARNES, who is taking charge o the Bill, brought forward an amendment to giv effect to the arrangements. He confessed that he d so with feelings of regret, but at this stage of the sess there were only two alternatives. The Bill must either b sacrificed or the amendment introduced. Medical opinio preferred to take the Bill in its amended form than ll. Several honourable Members took the same line, h they admitted that the introduction of the amend- ould not conduce to the effective working of the Bill. ely by 21 votes to 3 the committee decided to insert ds "habitually and for gain." The Bill as amended ered to be reported to the House.

Early Mental Cases.

Russell in the House of Lords on Wednesday, 22nd, presented a Bill to deal with early mental cases. d that its object was to enable persons who were in rly stages of lunacy to be placed under control on the rity of a medical man. The Bill avoided the use of the "certificate" because it was desired that it should carry ma. The Bill was read a first time. It is not proposed ceed further with it this session.

HOUSE OF COMMONS.

WEDNESDAY, JULY 15th.

Medical Inspectors under Mental Deficiency Act.

Snowden asked the Home Secretary what appoint- s had been made to the posts of medical inspectors the Mental Deficiency Act, whether all the persons nted were men, at what salaries they had been nted, whether the posts were advertised, whether it intended to appoint a woman or women medical ctors, and, if so, at what salaries.—Mr. McKenna d: Three such appointments have been made, all of at the following salaries: chief inspector, £200, in ion to his salary as inspector under the Inebriates one inspector, £500, rising to £800; one inspector, £400, to £600. The last two posts were advertised. It is ded to appoint a woman medical inspector, and pro- n is made in the Estimates for a salary of £350, rising to The Board of Control has not yet secured the services uitable person.

Sanatorium Benefit Funds.

jor Hope asked the honourable Member for St. George's- e-East, as representing the Insurance Commissioners, her there was any limit to the percentage of the sana- m benefit account for which Insurance Committees t take credit and expend on purposes of general adminis- on expenses of the committees.—Mr. Wedgwood Benn ered: No part of the sanatorium benefit funds of an rance Committee may be applied to defray the cost of administration expenses other than those actually rred either directly or indirectly in the administration natorium benefit. The amount so applied necessarily s in different areas, but is in all cases subject to review e Treasury auditors.

jor Hope: Is it possible to keep the administration nses of sanatorium and other benefits separate?—Mr. gwood Benn: I do not think it is practicable to do so.

Unremunerative Scientific Work.

Cowan asked the Prime Minister whether any existing is available out of which men of science might be pensated for losses incurred by them in doing un- nerative scientific work when such work had proved e of advantage to His Majesty's Government and cts; and whether, if no such fund was available, he ld consider the advisability of providing funds for ting such cases in the future.—Mr. Asquith said in y: I am not aware of any fund other than the Civil . The conditions for the granting of Civil List sions are laid down by Sections 5 and 6 of the I. and II. Vict. c. 2. I am not satisfied that further ision is necessary. I may add that nine pensions were nted last year for scientific services, two to scientists nselves and seven to their widows or daughters.

Housing in Rural Districts.

eplying to Mr. Lane-Fox, Mr. Runciman (President of Board of Agriculture) said that the number of local orities carrying out building schemes in agricultural ricts was extremely small. In selecting the agricultural ricts in which cottages were to be built under the pro- ns of the Housing Bill the Board would have regard to urgency of the demand and to the practicability of ining land at a reasonable price. He was prepared to der any representations which might be made to him half of local authorities, but the Board could not bind lf to refrain from exercising its powers in any particular ict merely on the ground that the local authority had not taken action under the Housing and Town ning Act. In reply to further questions the right ourable gentleman said that the experience in England that the local authorities had done very little in the cultural districts, but having embarked on this scheme osals brought forward for agricultural or other districts ld be considered on their merits.

Answering Mr. C. Bathurst, Mr. Asquith said that he hoped that the Government Housing Bill would be treated as a non-contentious measure and carried into law this session.

Medical Inspection in Secondary Schools.

Mr. Astor asked the President of the Board of Education whether any provision was made for the medical inspection and medical treatment of children attending secondary schools, and if so from what source was payment provided. —Mr. J. A. Pease wrote in reply: Medical inspection is provided in some secondary schools, and is paid for out of the funds available for the maintenance of the school. Where medical treatment is provided it is generally, I think, provided at the cost of and by arrangement with the parent. The honourable Member will find some information on the subject in the annual report for 1912 of the chief officer of the Board.

Committee on Food Preservatives.

In reply to Colonel Ivor Philipps, Mr. Herbert Samuel (President of the Local Government Board) wrote that he hoped to be in a position very shortly to announce the names of the Committee on Preservatives in Cream and other Food.

THURSDAY, JULY 16TH.

Scottish Clerks' Association and Medical Benefit.

Mr. Nield asked the honourable Member for St. George's-in-the-East, as representing the Insurance Commissioners, whether application was made by the Scottish Clerks' Association, whose head office was in Glasgow, to have their special medical scheme whereby a member had free choice of doctor, paid the charge incurred, and upon verification of such payment was reimbursed by the society, and which scheme the society had worked successfully for many years, recognised by the Commissioners in the event of them granting the application of the society to be an Approved Society under the Act; whether the society was informed, and when, that their medical scheme was accepted; whether such acceptance was subsequently repudiated; and, if so, when and for want reason.—Mr. Wedgwood Benn answered: The scheme referred to has at no time been approved by the Commissioners. The latter two parts of the question do not therefore arise.

Supply of Drugs by Panel Practitioners.

Mr. Wedgwood Benn informed Mr. Pratt that an arrangement was expressly provided for in the Regulations that in districts where there was no chemist available the Local Insurance Committee should arrange with the doctors on the panel for the supply of drugs and medicine for a capitation payment of 1*s.* 6*d.* per insured person. The arrangement had been found to work satisfactorily.

The Nursing Grant.

Major Hope asked the Chancellor of the Exchequer whether the House would have the opportunity of considering any scheme for the allocation and administration of the Budget grant in aid of nursing for the current year before such scheme was finally approved.—Mr. Lloyd George replied: It is proposed to present a supplementary estimate to Parliament this session in respect of the service referred to, and I hope that there will be an opportunity for discussion upon it.

Health Lectures.

Answering Mr. Astor, Mr. Herbert Samuel wrote: Section 60 (1) (*b*) of the National Insurance Act provides that the Insurance Committee of a county or county borough may make such provision for the giving of lectures and the publication of information on questions relating to health as it thinks necessary or desirable, and Section 61 (3) of that Act empowers any local authority to subscribe such sums as it may think fit towards the general purposes of the Insurance Committee. Subject to this I am not aware of any general statutory authority for county councils or sanitary authorities in England and Wales to provide lectures on matters relating to public health.

MONDAY, JULY 20TH.

Choice of Medical Man.

Mr. Nield asked the honourable Member for St. George's-in-the-East, as representing the Insurance Commissioners, whether the Commissioners, or any of the Insurance Committees acting under their directions, claimed to have an arbitrary power to refuse an insured person the choice of a medical attendant; if so, was there any appeal, and to whom, from any decision come to; and had any regulations been made upon the subject of applications by insured persons to make their own arrangements, or any definite directions given as to what circumstances should be taken into account in considering such applications.—Mr. Wedgwood Benn replied: Section 15 (5) of the Act of 1911 lays upon Insurance Committees the duty of deciding in the first instance upon applications from insured persons to make their own arrangements. Regulations have been made in pursuance of the section and the provisions of Section 67 (2) are applicable to these cases.

Medical Treatment of Sailors in Port.

Mr. FRED HALL (Dulwich) asked the honourable Member for St. George's-in-the-East whether in cases in which insured seamen were taken ill in a British port and ordered by a doctor into hospital the expenses which the hospital authorities might require the ship-owner to guarantee were in any circumstances recoverable from the insurance authorities; if they were not so recoverable, whether the ship-owner could be compelled to pay such expenses; and whether, in any proposals brought forward for the amendment of Part I. of the National Insurance Act, consideration would be given to the question of at any rate relieving ship-owners of any responsibility for expenses incurred in connexion with the medical treatment of insured seamen while in British ports.—Mr. WEDGWOOD BENN said in reply: The liability of a ship-owner to provide surgical and medical advice and attendance and maintenance during periods of illness in respect of the seamen employed by him is determined by the Merchant Shipping Acts, and is not affected by the provisions of the National Insurance Acts. I cannot undertake to anticipate the provisions of future legislation with regard to the liabilities of ship-owners to their employees.

Middlesex Insurance Surplus Funds.

Mr. WORTHINGTON-EVANS asked the honourable Member for St. George's-in-the-East whether the Middlesex Insurance Committee had yet distributed among the panel doctors any of the surplus funds for 1913; if not, what was the reason of the delay; and, if so, would he say what addition it had made to the fixed remuneration per head of persons treated.—Mr. WEDGWOOD BENN answered: Advances had been made to a total amount in excess of the amounts due in respect of insured persons on doctors' lists only, but the difference between the amounts due on the latter basis and the amount due in respect of the total insured population of the area entitled to treatment by doctors on the panel cannot be ascertained until the completion of the settlement now in progress.

Tuberculosis Treatment in Middlesex.

Mr. WORTHINGTON-EVANS asked the honourable Member for St. George's-in-the East whether the Middlesex Insurance Committee had distributed among the panel doctors of their area any sum for tuberculosis treatment; and if no such distribution had taken place, would he say what was the cause of the delay.—Mr. WEDGWOOD BENN replied: The answer to the first part of the question is in the affirmative. The second does not therefore arise.

Baby Clinics and Infant Dispensaries.

Mr. RAMSAY MACDONALD asked the Prime Minister whether it had now been decided what departments were to be responsible for the administration of grants to baby clinics and schools for mothers; and whether he could say what the arrangement was.—Mr. ASQUITH said in reply: Any funds available for grants to institutions of the nature of baby clinics and infant dispensaries, whose primary object is to provide medical and surgical advice and treatment for infants and little children, will be administered by the Local Government Board. Grants to institutions of the nature of schools for mothers, the object of which is primarily educational, which provide training and instruction for mothers in the care and management of infants and little children, and which may include systematic classes or home visiting or infant consultations, the provision of specific medical and surgical advice and treatment, if any, being incidental, will be administered by the Board of Education. Any cases of doubt or difficulty will be investigated by a joint committee of officers of the two Boards, which will include women medical officers.

Urban Housing.

Sir A. GRIFFITH-BOSCAWEN asked the Prime Minister whether the Government intended to deal with the question of urban housing.—Mr. ASQUITH replied: Yes, sir.

Imperial Military Nursing Service.

Dr. CHAPPLE asked the Under Secretary for War whether, under the regulations of Queen Alexandra's Imperial Military Nursing Service, it was compulsory for a staff nurse or sister to hold a certificate of three years' training in a recognised hospital.—Mr. TENNANT answered: Yes, sir.

Medical Inspectors under Mental Deficiency Act.

Lord NINIAN CRICHTON-STUART asked the Secretary of State for the Home Department whether he could state the names of the medical inspectors lately appointed under the Mental Deficiency Act.—Mr. MCKENNA answered: The names of the inspectors in order of seniority are:—Dr. R. W. Branthwaite, Dr. A. E. Evans, and Dr. S. E. Gill.

Outbreaks of Cow-pox.

Mr. W. THORNE asked the President of the Local Government Board whether the reports of the medical inspectors of the Board who investigated the outbreaks of cow
Frome in 1909, Sudbury in 1909, Oundle in 1911, and
in 1911 had been published.—Mr. HERBERT SAMUEL
Of the outbreaks referred to in the question onl
namely, that at Frome—was investigated by an insp
the Local Government Board. The origin of this o
of cow-pox could not definitely be ascertained, and
not considered necessary to publish the report. The
basis for the suggestion that the cows had been infe
the milkers, and I may mention that the affected c
were attacked subsequently to the cows on whic
attended. No fresh strains of vaccine lymph were o
in connexion with the outbreak.

TUESDAY, JULY 21ST.

Imperial Military Nursing Service.

Dr. CHAPPLE asked the Under Secretary for War w
there was an ample supply of applicants to fill staff
vacancies in Queen Alexandra's Imperial Military
Service.—Mr. TENNANT replied: Yes, sir, the supply is

WEDNESDAY, JULY 22ND.

Tenure of Medical Officers of Health.

Mr. CHARLES BATHURST asked the President of th
Government Board whether he proposed to issue bef
end of this session a general order which would sec
district medical officers of health and sanitary ins
greater security in the tenure of their offices; and
when such order would be issued.—Mr. HERBERT S
replied: The matter is still under consideration. I
be able to come to a conclusion on it at an early date.

PURCE, G. R. B., M.B. Belf., has been appointed House Surgeon at the Royal Victoria Hospital, Belfast.

STIRLING, WILLIAM, M.B., Ch.B. Manch., has been appointed Resident Surgical Officer to the Manchester Royal Eye Hospital.

WILLIAMSON, JAMES, M.B., Ch.B. Glasg., has been appointed Senior House Surgeon to the Manchester Royal Eye Hospital.

Vacancies.

For further information regarding each vacancy reference should be made to the advertisement (see Index).

BANBURY, HORTON INFIRMARY.—House Surgeon. Salary £120 per annum, with board and residence.

BARROW-IN-FURNESS, NORTH LONSDALE HOSPITAL.—House Surgeon. Salary £150 per annum, with residence, board, and laundry.

BEDFORD COUNTY HOSPITAL.—Assistant House Surgeon. Salary £100 per annum, with board, lodging, and laundry.

BETHNAL GREEN INFIRMARY, Cambridge Heath, E.—Second and Third Assistant Medical Officers. Salary at rate of £180 and £160 per annum respectively, with apartments, board, and washing.

BIRKENHEAD BOROUGH HOSPITAL.—Senior House Surgeon. Salary £120 per annum, with board and laundry.

BIRMINGHAM AND MIDLAND EYE HOSPITAL.—Locum Tenens as Junior House Surgeon. Salary 5 guineas weekly, with board and lodging.

BIRMINGHAM, QUEEN'S HOSPITAL.—House Surgeon for six months. Salary at rate of £50 per annum, with board, lodging, and washing. Also Secretary and General Superintendent. Salary £400 per annum.

BIRMINGHAM, ROMSLEY HILL SANATORIUM FOR CONSUMPTIVES.—Assistant Resident Medical Officer, unmarried. Salary £200 per annum, with board, apartments, and laundry.

BIRMINGHAM UNION, SELLY OAK INFIRMARY.—Resident Assistant Medical Officer. Salary £160 per annum.

BLACKBURN AND EAST LANCASHIRE ROYAL INFIRMARY.—Junior House Surgeon. Salary £100 per annum, with board, residence, &c.

BOOTLE BOROUGH HOSPITAL.—Senior and Junior House Surgeons. Salaries £120 and £100 respectively, with residence, board, and laundry.

BRADFORD ROYAL INFIRMARY.—House Surgeons, unmarried. Salary £100 per annum, with board, residence, and washing. Also Locum House Surgeon. Salary 6 guineas per week, with board, residence, and washing.

BRIGHTON THROAT AND EAR HOSPITAL, Church-street, Queen's-road.—Non-Resident House Surgeon for six months. Salary at rate of £150 per annum.

BRISTOL CITY ASYLUM.—Second Assistant Medical Officer, unmarried. Salary £200 per annum, with apartments, board, washing, and attendance.

CAMBERWELL INFIRMARY AND GORDON-ROAD INSTITUTION.—Assistant Medical Officer. Salary £200 per annum. Also Assistant Medical Officer for Infirmary. Salary £190 per annum. Apartments, board, and washing in each case.

CARDIFF, KING EDWARD VII.'S HOSPITAL.—Two House Surgeons for six months. Salary at rate of £100 per annum, with board, residence, and laundry.

CHELSEA INFIRMARY, Cale-street, S.W.—Second Assistant Medical Officer. Salary £160 per annum, with board, washing, apartments, &c.

CITY OF LONDON HOSPITAL FOR DISEASES OF THE CHEST, Victoria Park, E.—House Physician for six months. Salary at rate of £75 per annum, with board, residence, and washing.

COLCHESTER, ESSEX COUNTY HOSPITAL.—House Surgeon and House Physician. Salary £100 per annum each, with board, residence, and washing.

DEVONPORT, ROYAL ALBERT HOSPITAL.—House Surgeon, unmarried. Salary £150 per annum, with board and laundry.

DORCHESTER COUNTY ASYLUM.—Second Assistant Medical Officer. Salary £300 per annum, with board, &c.

EVELINA HOSPITAL FOR SICK CHILDREN, Southwark, S.E.—House Physician. Salary at rate of £75 per annum, with board, residence, and washing.

GLASGOW UNIVERSITY.—Lecturer in Pharmacology. Salary £350 to £400 per annum. Also Assistant in Department of Physiology. Salary £150 per annum.

GRIMSBY AND DISTRICT HOSPITAL.—Senior House Surgeon. Also Junior House Surgeon. Salaries £100 and £[illegible] per annum respectively, with board, lodging, attendance, and washing.

HARTLEPOOL, BOROUGH OF.—Medical Officer of Health and School Medical Officer. Salary for combined appointment £[illegible] per annum.

HELLINGLY, EAST SUSSEX COUNTY ASYLUM.—Assistant Medical Officer.

HEXHAM RURAL DISTRICT COUNCIL.—Medical Officer of Health. Salary at rate of 250 guineas per annum.

HULL ROYAL INFIRMARY.—Senior House Surgeon, unmarried. Salary £150 per annum, with board and apartments. Also Assistant House Surgeon. Salary at rate of £[illegible] per annum, with board and lodging.

HULL, VICTORIA CHILDREN'S HOSPITAL, Park-street.—Female Assistant Resident House Surgeon. Salary £[illegible] per annum, with board and laundry.

INVERNESS, NORTHERN INFIRMARY.—House Surgeon. Salary £100 per annum, with board, &c.

JOHANNESBURG, SOUTH AFRICAN INSTITUTE FOR MEDICAL RESEARCH.—Superintendent of Routine Division. Salary £[illegible] per annum. Also Curator of Museum, Photographer, and Photomicrographer, unmarried. Salary £[illegible] per annum.

LEAMINGTON SPA, WARNEFORD, LEAMINGTON, AND SOUTH WARWICKSHIRE GENERAL HOSPITAL.—House Surgeon and House Physician. Salary £100 and £[illegible] respectively, with board, residence, and laundry.

LEEDS, CITY HOSPITALS FOR INFECTIOUS DISEASES AND TUBERCULOSIS.—Two Assistant Medical Officers, unmarried, for six months. Salary at rate of £130 per annum each, with board, lodging, and washing.

LEEDS GENERAL INFIRMARY.—Two House Physicians for six months, without salary, but with board, residence, and laundry. Also Assistant Clinical Pathologist. Salary £150 per annum and luncheon. Also Resident Medical Officer at the Ida and Robert Arthington Hospitals for six months. Salary £60 per annum, with board, residence, and laundry.

LEEDS TUBERCULOSIS ASSOCIATION SANATORIUM, Gateforth, near Selby.—Resident Medical Officer for six months. Salary at rate of £100 per annum, with board, lodging, and washing.

LEICESTER ROYAL INFIRMARY.—Assistant House Surgeon and Assistant House Physician for six months. Salary at rate of £100 per annum, with board, apartments, and washing.

LIVERPOOL SCHOOL OF TROPICAL MEDICINE.—Research Assistant at Runcorn Research Laboratory. Salary £150 per annum.

LONDON LOCK HOSPITAL.—House Surgeon to Female Hospital, Harrow-road, W. Salary £100 per annum, with board, residence, and washing.

LONDON TEMPERANCE HOSPITAL, Hampstead-road, N.W.—Assistant House Surgeon for six months. Salary at rate of £105 per annum. Also Assistant Resident Medical Officer for six months. Salary at rate of £80 per annum, with board and residence.

MAIDSTONE, KENT COUNTY ASYLUM.—Fourth Assistant Medical Officer, unmarried. Salary £250 per annum, with quarters, board, attendance, washing, &c.

MAIDSTONE, KENT COUNTY OPHTHALMIC HOSPITAL.—House Surgeon, unmarried. Salary £100 per annum, with board, residence, and laundry.

MAIDSTONE, WEST KENT GENERAL HOSPITAL. — Assistant House Surgeon, unmarried. Salary £80 per annum, with board, lodging, &c.

MANCHESTER CHILDREN'S HOSPITAL, Pendlebury.—Secretary. Salary £250 per annum. Also Resident Medical Officer, unmarried, for six months. Salary at rate of £100 per annum.

MANCHESTER HOSPITAL FOR CONSUMPTION AND DISEASES OF THE THROAT AND CHEST.—Assistant Medical Officer and Pathologist. Salary £60 per annum. Also Resident Medical Officer for In-patient Department, Bowdon, Cheshire. Salary £100 per annum, with board, apartments, washing, &c.

MANCHESTER, HULME DISPENSARY, Dale-street, Stretford-road.—House Surgeon. Salary £180 per annum, with apartments, attendance, coal, and gas.

MANCHESTER, MONSALL FEVER HOSPITAL.—Fourth Medical Assistant. Salary £150 per annum, with board, lodging, and washing.

MANCHESTER NORTHERN HOSPITAL FOR WOMEN AND CHILDREN, Park-place, Cheetham Hill-road.—House Surgeon. Salary £120 per annum, with apartments and board.

MANCHESTER ROYAL EYE HOSPITAL.—Junior House Surgeon. Salary £80 per annum, with residence, board, and washing.

MANCHESTER ROYAL INFIRMARY.—Medical Officer for Out-Patients and Accidents for six months. Salary at rate of £100 per annum, with board and residence.

MANCHESTER, ST. MARY'S HOSPITALS FOR WOMEN AND CHILDREN.—Four House Surgeons.

METROPOLITAN HOSPITAL, Kingsland-road, N.E.—House Surgeon and Assistant House Surgeon for six months. Salary at rate of £60 and £40 respectively, with board and washing.

NATAL, PROVINCE OF.—Medical Officer for Medical Inspection of Schools. Salary £700 per annum.

NEWARK-UPON-TRENT HOSPITAL.—Resident Medical Officer, unmarried. Board, lodging, and laundry provided.

NEWCASTLE-UPON-TYNE, ROYAL VICTORIA INFIRMARY.—Medical Registrars and Surgical Registrars. Salary at rate of £50 per annum.

NORTHAMPTON GENERAL HOSPITAL.—House Surgeon. Salary £120 per annum, with apartments, board, washing, attendance, &c.

NOTTINGHAM, BAGTHORPE INSTITUTION AND INFIRMARY.—Resident Assistant Medical Officer, unmarried, for six months. Salary at rate of £165 per annum, with apartments, &c.

NOTTINGHAM GENERAL DISPENSARY.—Assistant Resident Surgeon, unmarried. Salary £180 per annum, with apartments (not board), attendance, light, and fuel.

NOTTINGHAM GENERAL HOSPITAL.—Assistant House Physician for six months. Salary at rate of £100 per annum, with board, residence, and laundry.

OLDHAM ROYAL INFIRMARY.—Senior House Surgeon and Third House Surgeon for six months. Salary at rate of £140 and £100 per annum respectively, with residence, board, and laundry.

OXFORD, CITY OF.—Assistant Medical Officer of Health and School Medical Officer. Salary £300 per annum.

PADDINGTON GREEN CHILDREN'S HOSPITAL, London, W.—House Surgeon. Salary at rate of £80 per annum, with board, residence, and washing.

PLYMOUTH INCORPORATION OF GUARDIANS WORKHOUSE AND INFIRMARY.—Resident Assistant Medical Officer. Salary £200 per annum, with apartments, rations, and washing.

PORTSMOUTH ROYAL HOSPITAL.—House Surgeon for six months. Salary £90 per annum, with board, &c.

PUTNEY HOSPITAL, Putney Common, S.W.—Resident Medical Officer. Salary £100 per annum, with rooms, board, and laundry.

QUEEN'S HOSPITAL FOR CHILDREN, Hackney-road, Bethnal Green, E.—House Surgeon for six months. Salary £80 per annum, with board, residence, and washing. Also Female House Physician and Casualty House Surgeon for six months. Salary £80 per annum, with board, residence, and washing.

READING EDUCATION COMMITTEE.—Assistant Medical Officer. Salary £300 per annum.

RETFORD, STATE CRIMINAL LUNATIC ASYLUM.—Assistant Medical Officer, unmarried. Salary £225 per annum, with quarters, coals, light, and attendance.

ROCHDALE INFIRMARY AND DISPENSARY.—Senior House Surgeon, unmarried. Salary £120 per annum, with board, residence, and laundry.

ROYAL DENTAL HOSPITAL, Leicester-square, W.C.—Two House Anæsthetists.

ROYAL EYE HOSPITAL, Southwark, S.E.—Junior House Surgeon. Salary £50 per annum, with board and quarters.

H AND SANITATION IN NORTHERN NIGERIA.

st detailed report received at the Colonial Office on airs of Northern Nigeria states that malaria con- to be the most prevalent cause of ill-health. It has ointed out by medical and sanitary authorities that adily increasing mining and commercial activities country have been responsible for the introduction nbers of Europeans who have never previously in the tropics, while the number of natives who the aid of the medical department is yearly g. It follows that it is quite possible that for some o come malarial fever may increase statistically in point of fact it may be really decreasing. The of medical officers and residents to combat small- mongst the natives by vaccination continue to be ful; tactful handling yearly induces a larger r to offer themselves for vaccination. The infant ity from small-pox and fever is enormous, and the native is slow to take any precaution for f he is easily approached when the danger to ildren is made manifest to him. Only ocular strations, however, will induce him to believe that grubs," as he knows them, become mosquitoes, s ocular demonstration of the further connexion n mosquitoes and fever cannot yet be given, pro- n combating fever must be slow.

ing sickness is well known in the valley of the and in the southern provinces generally, and its ce is also reported in the Central Province. The "cure" is the application of raw rubber to an n in the neck which exposes the gland; rubber and ogether are torn off when the rubber has coagulated. provinces have established segregation villages for and in Yola the results are reported to be satis- , but the Resident of Bornu states that segregation s extremely unpopular, and this may probably be s the general attitude.

time of the two European officers of the Sanitary ment has been occupied principally in advising the ve on all matters affecting hygiene and sanitation, visiting the provinces and reporting on the sites of ent stations, or advising where future sites should particular spots on which residential quarters be erected. With the active coöperation of the l officers the sanitary officers are endeavouring to s on native chiefs the need for, and benefits that will from, the proper sanitation of their towns. In the nlightened northern provinces possessing effective administrations much progress is being made, but be difficult to induce the natives of the southern belts to make improvements until effective native strations have been created in those districts. The l of sewage and refuse are matters in which the generally is not concerned, but in many of tive towns of the north, notably Kano, where ve cultivation is practised, the demand for e tends to the removal of insanitary refuse, and ultivators in those districts understand the ial value of combustible rubbish burned on the . The water-supply is principally derived from s, streams, wells, and marshes. Excepting in the f well-built European dwellings the houses have ed roofs, so that any large collection of rain water is ssible. At most of the stations Europeans are daily d with condensed water for drinking and cooking es. All the water supplied to prisons and native ls is boiled. Everything possible is being done to the natives to safeguard their wells by the con- on of parapets to keep out the surface drainage, and cting sites for the sinking of wells away from the ourhood of salgas (native latrines) to guard against nination. There is no system of pipe or other form erground drainage, and surface drainage is effected natural fall of the ground towards streams, but he greater part of the country percolation is free a rule, fairly rapid. A considerable amount of labour nded on clearing operations at the various stations the months of July, August, September, and October, getation then being exuberant. Bush is cleared he inhabited parts of stations, and the clearing is more extensive in regions where tsetse flies prevail. native towns the practice of keeping undergrowth y surrounding the town with short crops, such as nuts, sweet potatoes, and beans, is steadily spread- Elementary hygiene is being taught at the Govern- schools at Nassarawa, and one of the medical officers o is now attached to the schools and Kano City, his being tutorial as well as medical.

FORCIBLE FEEDING: A SIDE ISSUE.

A COMMUNICATION has been sent to us for publication signed by Dr. James W. McIntosh (chairman), Dr. L. Haden Guest, Sir Victor Horsley, Mr. C. Mansell Moullin, and Dr. Frank Moxon, of the Forcible Feeding Protest Committee of Medical Men, which refers to the possibility that prisoners if they do not give up voluntary starvation might be certified as insane and incarcerated in an asylum. The communication encloses a copy of a letter received on July 14th from a convicted male criminal who had refused food and undergone forcible feeding (according to his own account) 238 times at Northampton and Wormwood Scrubbs prisons, and had then been transferred to the Bucks County Asylum on a warrant of detention by order of the Home Secretary. Dr. McIntosh, Sir Victor Horsley and Dr. Guest state that they visited the asylum last week and found no evidence of insanity in this prisoner, but that he had been certified on the reception order by the medical men as insane on the ground that he refused food. They further allege that a week after transference to the asylum the medical superintendent made a report which not only contained no evidence of the prisoner being insane, but definitely stated that he talked quite coherently, that his memory was good, and that he had eaten his food since admission.

GLYCOSURIA AND THE SUGAR INDUSTRY.

To the Editor of THE LANCET.

SIR,—In your issue of April 18th there is a question from Dr. F. C. MacNalty, of Winchester, as to the occurrence of glycosuria amongst those working on sugar-cane estates. One of the hospital assistants here, a Chinaman, on his own initiative, examined some years ago many specimens of urine obtained from men engaged in the crushing of sugar-cane. He found that Fehling's solution was reduced by every specimen he tested. There is no muzzling of the ox that turns the stones between which the cane is crushed, and equally little restraint is put upon the men and boys engaged in the work.

I am, Sir, yours faithfully,

Swatow, China, June 29th, 1914. G. DUNCAN WHYTE.

PLAGUE IN JAVA.

A CONSULAR report on the affairs of Java (Dutch East Indies) states that there have been epidemics of cholera and small-pox, but that the health of the island was, on the whole, better in 1913 than in 1912. The measures taken to combat the plague in East Java have been continued vigorously, but the disease shows no signs of abatement. The number of cases of plague during 1913 was 12,055, and the number of deaths 11,305. There were about 600 European British subjects in Java at the end of 1913.

CONJUNCTIVITIS DUE TO FACE POWDER.

IN the *Journal of the American Medical Association* of April 8th, Dr. N. M. Black has called attention to a cause of conjunctivitis which appears not to have been previously recognised—the use of "face powder." For several years cases have come under his observation with a similar train of symptoms and microscopic appearances of the conjunctival secretion. The patients, invariably women, complain of vision frequently being blurred, inability to use the eyes for any length of time for near vision, and severe itching of the lids. The slightest rubbing of the lids produces marked bulbar hyperæmia and only aggravates the itching. In severe cases the lids become œdematous from the constant rubbing. There is a mucilaginous secretion in varying amounts, which is elastic, and on removal pulls out in long strings. Microscopic examination of the secretion shows numerous epithelial cells mixed with what appear to be pentagonal crystals, the majority having a central black spot. In a few cases many fine amorphous crystals are also present. Smears taken from these cases were shown to a number of pathologists, bacteriologists, and chemists, but a satisfactory explanation could not be obtained. Some suggested that the "crystals" might be secreted by the lacrymal gland, others that they were artefacts. Slides prepared from the eyes of two sisters having the usual train of symptoms were submitted to Dr. C. H. Bunting, professor of pathology in the University of Wisconsin College of Medicine. He wrote as follows: "After trying various solvents I found that strong alkalies caused the crystals to swell and become spherical, with a doubly contoured wall. When they swelled enough to rupture, iodine showed that they discharged soluble starch into the surrounding fluid. So you are dealing with plant cells, probably from face powder. They are not lycopodium." After examining various face and dusting powders Dr. Bunting said that the "crystals" came from rice powder. He thought they must be the cells from the hard exterior [illegible]. The fine "amorphous crystals" [illegible] in face but not in rice powder. He could not determine their nature. Several other patients presenting the same symptoms and microscopic conditions used face powder made by the same firm. Dr. Black gives the following explanation. When the powder is applied to the face with a puff some fine dust arises and lodges on the moist conjunctiva. The rice flour, rendered mucilaginous by the tears, is not washed away. The woody cells of the hard exterior of the rice grain swell, and, being angular, produce conjunctival irritation, which is aggravated by rubbing. Those who use chamois to apply the powder are less likely to cause fine dust to arise. This accounts for the conjunctivitis not being produced in every person using face powder. The symptoms are quickly relieved by flushing the conjunctival sac with boric or normal saline solution and the use of an ointment made of equal parts of lanoline and petrolatum, which seems to agglutinate the cells and allow their being easily flushed out.

A DISCLAIMER.

To the Editor of THE LANCET.

SIR,—May I ask the courtesy of your columns to state that an article purporting to express my opinions, and quoting from my medical writings, which has appeared yesterday in a daily journal, has been issued entirely without my consent or authority, and to my great annoyance.

I am, Sir, yours faithfully,
London, July 15th, 1914. R. FORTESCUE FOX.

GOGGLES FOR POLAR EXPLORERS.

THE officers of the forthcoming Antarctic Expedition, which is to be led by Sir Ernest Shackleton, have devoted special attention to the question of protection against snow blindness, which, as is well-known, has caused a great deal of suffering and inconvenience in previous expeditions to the Antarctic. Every member of the expedition has been supplied with a special pair of goggles, which it is anticipated will provide all possible protection. The form of these goggles in ordinary cases is a pair of gauze eye cups made of aluminium-nickel alloy, joined together by an adjustable leather bridge. The edges of the cups which touch the skin are leather bound and the goggle is fixed by an adjustable leather strap passing round the head. Each goggle has been glazed with lenses ground in euphos glass made to the formula of Professor Schantz, in the tint commercially known as No. 4. This glass has been proved experimentally at the National Physical Laboratory and elsewhere to absorb the whole of the ultra-violet rays. Up to the present the only instance recorded in which this glass has been used in polar exploration was on Amundsen's Expedition, when he and his assistant, Hansen, both wore Professor Schantz's glass, and were the only two members of the expedition doing so. They record that they were the only two members that did not suffer from snow blindness in any degree. In the case of one of the surgeons of the expedition, who is astigmatic to the extent of 3½ diopters, the only difference made has been to fix a leather-bound rigid bridge instead of the adjustable one so that the whole goggle front itself will be perfectly rigid, all minor adjustments for axis can be easily made in fixing the leather strap round the head. In the case of one of the geologists, who is myopic to the extent of 4 diopters, a film of euphos glass has been fused on to a white blank, on which blank the whole of the correction has been ground, so that equal tint protection is provided from centre to edge, irrespective of the varying thicknesses of the glass. Each man has been provided with a spare pair of lenses, and the frame is so made that on levering up a little of the leather binding on the edge of the cup a pin can be easily removed which opens the rims, and after replacing the broken lens the rims can be just as easily fastened together again by re-insertion of the pin. The expedition has also been supplied with tubes of a special preparation with which the lenses can be cleaned and polished, and which will prevent the condensation of the wearer's breath on the glass. Sir Ernest Shackleton has reported, after using specimen goggles made for experiment on his Norway Test Expedition, that they proved to be satisfactory in every particular, and it is anticipated that as a result of the wearing of these glasses there will be very little trouble caused by the effects of snow glare on the eyes of the members of the expedition.

URINE-COLLECTING BOTTLES.

IN reply to U.C.B.'s inquiry in THE LANCET of July 18th, a correspondent writes to say that the urine bottle referred to was suggested by Dr. H. Carter Thorp, of Ryde, and described in THE LANCET of August 23rd, 1902. It is made by Messrs. Down Bros., Limited, St. Thomas's-street, S.E., and shown in their catalogue.

PARTNERSHIP.[1]

MR. H. C. Emery has in a recent book compiled handy and convenient summary of the law of partn ships under the Partnership Act, 1890, and the Limit Partnership Act, 1907, which should be of use to perso entering upon commercial partnerships as well as lawyers in practice. The facts and circumstances medical partnership have little relation to those dea with in such a volume, but it may be suggested that t provisions of the Limited Partnership Act may sometim be of use to medical men who desire to invest capital minor commercial undertakings.

Messrs. Angus and Co., of 83, Wigmore-street, London, W have issued an abridged catalogue of the microscop and accessory apparatus manufactured by the fi C. Reichert, of Vienna, for whom they are the agents this country. It is interesting to note that since t foundation of the firm in 1876 they have produced an sold some 55,000 microscopes—a testimony to the scienti accuracy of their instruments.

◆

Mr. Boulton Hall.—The passage is correctly quoted fro THE LANCET, but much has since been written on t subject, indicating that nicotine is not the only harmf ingredient in tobacco-smoke.

A. V. (Barcelona).—This treatment is no longer regard seriously. The last reference was a special article o Some Constituents of Violet Leaves, which appeared i THE LANCET of April 22nd, 1905.

COMMUNICATIONS not noticed in our present issue wi receive attention in our next.

(St. Petersburg).—Third Mendeléeff Congress of Pure and Applied Chemistry and Physics.

EDITORIAL NOTICES.

IT is most important that communications relating to the Editorial business of THE LANCET should be addressed *exclusively* "TO THE EDITOR," and not in any case to any gentleman who may be supposed to be connected with the Editorial staff. It is urgently necessary that attention should be given to this notice.

It is especially requested that early intelligence of local events having a medical interest, or which it is desirable to bring under the notice of the profession, may be sent direct to this office.

Lectures, original articles, and reports should be written on one side of the paper only, AND WHEN ACCOMPANIED BY BLOCKS IT IS REQUESTED THAT THE NAME OF THE AUTHOR, AND IF POSSIBLE OF THE ARTICLE, SHOULD BE WRITTEN ON THE BLOCKS TO FACILITATE IDENTIFICATION.

Letters, whether intended for insertion or for private information, must be authenticated by the names and addresses of their writers—not necessarily for publication.

We cannot prescribe or recommend practitioners.

Local papers containing reports or news paragraphs should be marked and addressed "To the Sub-Editor."

Letters relating to the publication, sale, and advertising departments of THE LANCET *should be addressed "To the Manager."*

We cannot undertake to return MSS. not used.

MANAGER'S NOTICES.

THE INDEX TO THE LANCET.

THE Index and Title-page to Vol. I. of 1914, which was completed with the issue of June 27th, were given in THE LANCET of July 4th.

VOLUMES AND CASES.

VOLUMES for the first half of the year 1914 are now ready. Bound in cloth, gilt lettered, price 16*s.* carriage extra.

Cases for binding the half-year's numbers are also ready. Cloth, gilt lettered, price 2*s.*, by post 2*s.* 3*d.*

To be obtained on application to the Manager, accompanied by remittance.

TO SUBSCRIBERS.

WILL Subscribers please note that only those subscriptions which are sent direct to the Proprietors of THE LANCET at their Offices, 423, Strand, London, W.C., are dealt with by them? Subscriptions paid to London or to local newsagents (with none of whom have the Proprietors any connexion whatever) do not reach THE LANCET Offices, and consequently inquiries concerning missing copies, &c., should be sent to the Agent to whom the subscription is paid, and *not* to THE LANCET Offices.

Subscribers, by sending their subscriptions direct to THE LANCET Offices, will ensure regularity in the despatch of their Journals and an earlier delivery than the majority of Agents are able to effect.

THE COLONIAL AND FOREIGN EDITION (printed on thin paper) is published in time to catch the weekly Friday mails to all parts of the world.

The rates of subscriptions, post free from THE LANCET Offices, have been reduced, and are now as follows:—

FOR THE UNITED KINGDOM.		TO THE COLONIES AND ABROAD.	
One Year	£1 1 0	One Year	£1 5 0
Six Months	0 12 6	Six Months	0 14 0
Three Months	0 6 6	Three Months	0 7 0

(The rate for the United Kingdom will apply also to Medical Subordinates in India whose rates of pay, including allowances, is less than Rs.50 per month.)

Subscriptions (which may commence at any time) are payable in advance. Cheques and Post Office Orders (crossed "London County and Westminster Bank, Covent Garden Branch") should be made payable to the Manager, Mr. CHARLES GOOD, THE LANCET Offices, 423, Strand, London, W.C.

TO COLONIAL AND FOREIGN SUBSCRIBERS.

SUBSCRIBERS ABROAD ARE PARTICULARLY REQUESTED TO NOTE THE RATES OF SUBSCRIPTIONS GIVEN ABOVE.

The Manager will be pleased to forward copies direct from the Offices to places abroad at the above rates, whatever be the weight of any of the copies so supplied.

SOLE AGENTS FOR AMERICA—MESSRS. WILLIAM WOOD AND CO., 51, Fifth Avenue, New York, U.S.A.

METEOROLOGICAL READINGS.

(Taken daily at 8.30 a.m. by Steward's Instruments.)
